Thanks but there is no provision for a YK-88SN-1 either. The manual shows how to install a narrow CW filter or an AM filter but there is no mention of a narrow SSB filter. I guess they figured that the 'slope' tuning was adequate.

I am considering installing the SN in place of the existing S filter but that's a job, involving lifting the signal board. And I lose the wider characteristic.

Where is it you think I should be plugging in an SN-1 filter?

73, Bob

Andy:

A 13.5 Volt DC supply is within 12-15 specified with your kit, so it is fine. The current capability of the supply (2.5 Amps) is well above the current drain of your transmitter (450 mA) so that is also fine. The ability of your PS to deliver more current than the load your transmitter will put on it is a good thing. Don't worry.

Source record: 58593

If the input power of the transmitter is a product of the supply voltage and current, then taking efficiency into account, there will be losses in the output device, and the matching network, but the output power will again (with a perfect match) be a product of the rms voltage and current.

The output matching network will transform the output rms voltage to whatever, again leaving the output power dependant on the current.

As a rough example, (although this is unlikely in practice due to the losses!) Input V = 3, input A = 33, therefore input watts = 99. Assume approx 50% efficient, the output power will be 50 watts, and across a perfect 50R load, the output A = 1. Output V = 50 (RMS).

Remember that the output coupling network is a transformer, and in a tube amp is a step down transformer, but in a transistor amp, is a step up transformer.

So, no, the output power is not limited by the low supply voltage directly, although the use of such a low supply voltage will cause poor efficiency, not only due to DC losses as a result of the high supply current, but also due to the very large circulating RF current in the output tank.

Hope that helps,

Regards,

Stan, G4EGH.

Many thanks to all for the suggestions re loose tube bases.
I wonder if "Water Glass" and mention of the druggist has any relationship to the word "Isinglass" which stirs a distant, very distant btw, memory with me in connection with something with a name like that being available at 'Chemists Shops' in UK. Or am I imagining something? A pwdered crystalline substance to be mixed with water, comes to mind; but maybe I'm thinking of something that was used to preserve whole eggs in shell, not a glue?
Oh, and reference the tube that Lee mentioned that wasn't straight! We used to have the expression "Skew-wiff". As in "Come on mate you put that in 'skew-wiff'; din'yer."

Eddy currents indeed can cause problems ,however as previously
discussed in this NG the welds are superficial hence Eddy currents
would not be a problem . But the magnetic shunts are a problem and
should be removed before trying to use the tranny for a HV PSU.

Actually, I have only made measurements with a simple DVM with
digital frequency meter built-in.

There are three terminals. Using one pair I got what appears to be
approximately 20 Hz and on the other pair I got a reading of 60 Hz.

Maybe it is a false reading. I do not have access to a scope here at
present. The voltage is fairly constant while turning at different
speeds.

Greetings ALL:

This is the final notice with only eight hours remaining.

19" Desktop equipment rack/cabinet

The outside dimensions are 24" (W) x 13" (H) ax 16" (D)
The inside (opening) dimensions are 19" (W) x 8.75" (H) x 15.5" (D)* This measurement is from mounting rib to mounting rib (front to back). It also has two rails on the inside bottom that are adjustable, width wise.
Top and Bottom panels are screens.

Congratulations Jim Bennett. KG4JBM.

As long as the output of your power supply is reasonably 'smooth', that is very little hum due the the rectification of the AC to DC it will work fine. With traditional type power supplies such as yours it is an advantage to have some extra capacity because the output voltage will tend to stay the same even when the load increases. When transmitter is 'off' load is zero or very little; when transmitter is on, or keyed, load increases to, say 450 m/a. Note 1.

The amount that you mention, 450 milli amps (i.e. 0.45 amps), is quite small compared to the rated 2.5 amps of the power supply. If you did ever have a problem with the voltage changing (swinging) as you applied this relatively small load you could come back here and I'm sure someone could advise what to do. (Bleeders).

Good luck with Amateur Radio. 'Non Ham'.

PS. Written a few miles from where Marconi in 1901 received the first trans Atlantic wireless message! dit dit dit.

PPS. I remember many, many, years ago reading an article about two amateurs who were experimenting with a 'one quarter watt' tube transmitter; using an ex WWII battery operated home built tube transmitter. Even competing, in those days, with strong Amplitude Modulated signals of up to 500 watts they were successful in trnasmitting and receiving each other over several hundred miles! On 40 meters I think it was?

Note 1. There has been a certain amount of knowledgeable discussion recently on these news groups about using computer 'switching type' power supplies, for amateur equipment. A whole different subject, because apparently some of them HAVE to have a certain amount of load on on each one of their outputs in order to work properly. Also some of the postings indicate that many of them are not sufficiently filtered for use with radio equipment because they emanate a certain amount of noise at radio frequencies due to the internal switching action of the power supply itself. Switching power supplies are usually much lighter than the traditional power supplies which use heavy 60 cycle transformers and also heavy chokes and big capacitors for 'smoothing' the rectified DC.

Perhaps not 'ringing generators'?

Maybe these were the generators designed to provide power for emergency life raft equipment. Anybody remember the 'Gibson Girl' hand cranked emergency transmitters for use by downed WWII aircraft crews?

They incorporated a hand crank generator, had a unique shape (hence the name!) {Was it Dorothy Gibson btw? The memory and testosterone ain't what it used to be! But maybe an old film star aficionado can advise?}. They were painted bright yellow. They appeared on the 'surplus' market after the war when I was a teenager. Also one was advertised for sale on the internet within last two years.

I recall they used one 12A6 tube? Radiated on 500 kilocycles (the international CW distress frequency) and had a continuous mode and a rubber covered button to be used as a morse key? I also remember a kite antenna and long wire.

I never studied them; but perhaps the two outputs of the generator were a) 12 volts for the 12A6 heater and b) 120 volts for B+ for the emergency transmitter? I don't think there was a rectifier tube? Maybe the transmitter was supplied with AC B+ or rough DC B+ through contacts on the hand generator?

Does any of this make any sense or can someone more knowledgeable (and maybe a little older!) deny or confirm.

PS. I even had trouble 'spelling' testosterone! Now where's that "Spell check".

I have the following tubes for sale.
==========
1. GS35B - $120.00 1.5kw to 1000mhz
For specs see this Link
http://home.iae.nl/users/pe1ogf/gs-35.htm
2. 4CX1600U/GS23B - $180.00 1.5kw to 1000mhz For specs see this link
3. http://www.qsl.net/ut7ct/gs-23b.html
GS36B - $90.00 great 440 mhz tube
For specs see this link
http://www.qsl.net/ut7ct/gs-36b.html
4. 4CX800A/GU74B - $200.00 matched pair. HF and 2 meters pair= 1.5KW For specs see this link
http://www.qsl.net/ut7ct/gu-74b.html
5. SK1A sockets - $39.95 ea. These are the sockets for the 4cx800a/gu74b Svetlana tubes. They are brand new, never used. The very same socket sells elsewhere for $59.95
Shipping on most orders is $10.00
==========
All the tubes are Svetlana brand, unused, and are in great condition. All are guaranteed to arrive in great shape and to not be DOA. For more info please see my website, and if you have any questions, I will be glad to answer them if I can, just send me an email. Thanks for your time and 73.

1748. Where to find datasheet for MRF449A?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-16 00:00:00 UTC
From: Cory Papenfuss <papenfus@juneau.ece.uiuc.edu>
Message-ID: <8qAm5.1010$9N1.17546@vixen.cso.uiuc.edu>
Source record: 58531

I've gotten ahold of a couple of old HF output transistors
(MRF476, MRF449A, MRF421), and I was figuring to make a linear amplifier
for the 1-30 MHz range. The trouble is that I can't find the datasheets
for these suckers. I know roughly what they are capable of from the
motorola appnotes, but no datasheets. I've even looked through the paper
databooks, but can't find them. Anyone know where to look?

Also, if there's anyone knows of a starting-point schematic for
this approx 50-100W amp, I'd appreciate it.

Thanks,
-Cory

>covered button to be used as a morse key? I also remember a kite antenna
>and long wire.

You forgot the balloon and tube to immerse in sea water for generating
hydrogen to fill the balloon!

I still have a roll of that antenna wire--braided stuff for maximum
flexibility. May have the entire Gibson Girl transmitter in my
junque-filled basement, too.

Try Motorola's web site. There's a link on my page (below). I remeber
seeing a design for a class A PA using the MRF449 in Solid State Design
for the Radio Amateur.

From: Oliver <rockets-nospam@attglobal.net>
Message-ID: <spltserer5j103@corp.supernews.com>
Source record: 58536

Thanks for the link. I am unclear on 2 items though:

> X.......Crystal, type FM1. 3rd overtone for 145-160MHz, 5th overtone for
220 MHz
What does "3rd overtone" refer to?

> wire... wire used to provide capacity to the animal
How does this translate to the application with a rocket?

What would be the estimated power output from the transmitter at that link?
Can I drive this with 12 Volt to increase power output?

I'd like to build a transmitter for 433 MHz, as I already have the antenna
and receiver for that frequency.

> Then why would you use AM or FM?
I don't think I understand your question completely. From your description
FM wouldn't work well for RDF. Do I understand that correctly? AM should
work fine? If this is the case, thanks for pointing this out to me. I
would not have thought about that.

> Loose the FM HT.
What does HT stand for?

Do you have a link to the commercial unit you are referring to?

In this case it was the ground that was the problem and the transmitter,
antenna, and ground radials tied to an 8 foot ground rod were all at 110 VAC
line.

BTW, the Yaesu did have the choke across the antenna leads. Generally it's
right across the coax connector (SO-239)

Hi Paul,

Never had anyone call me Forum before....

You really want a lot don't you Paul? More specifics like the application would be helpful. We don't know what impedances you need, etc... etc.

Something with your listed frequency responce is a pretty serious amplifier, I doubt the average Joe can help you out. Check out Amplifier Researh's web page for some realistic broadband amplifiers. You won't like the price though, it's all serious stuff.

http://www.ar-amps.com

I deal with broadband, bb-linear, pulse and switch mode amplifiers all the time. It's just realistic for me to tell you to be more specific with your application, then learn what your really asking for.

cheers

In the UK, the ZX80 never really took off (much). It was the ZX81 which
became all the rage, until it was superceded by the ZX Spectrum (colour,
and with a rubber-button keypad). Many computer nerds of today learned
their skills on these!

From: LA8AK@online.no
Message-ID: <399b18e6.75004@news.online.no>
Source record: 58542

need some general info for power mosfets, do you know any site showing direct relationship between drain current and gate voltage for any typical power device. I intend to choose between IRF630 and a power darlington device. It seems that source-gate voltage varies much more over a drain (collector) current than emitter-base voltage. Darlingtons seem better for certain linear regulators, but I need a curve to prove it

Do you know any site showing such diagrams?

That usually helps, but many years ago I was running a Globe Champion (pair of 807s) with no cabinet (for some reason) and reached toward the back for something, managing to lay the arm across the plate caps and the top of the front panel. That left marks that took a while to go away.

I usually wear Velco watchbands which does help avoid the welded watchband/burned wrist problem.

The Stamp is great to learn on - and for less than $100 you're in business. You can contact parallax directly at www.parallaxinc.com or buy the stuff from Jameco.

At $49 a pop for a BS-II (are they higher now?), however, you will probably want to graduate to the PICBasic Pro compiler which uses the stamp like language to program Microchip PIC's - saving about 80% of the cost.

1767. Total Newbie: Now KG4JBM !!!

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-16 03:28:28 UTC
From: cathexis@erols.com
Message-ID: <399a004f.258622249@news.erols.com>
Source record: 58518

Greetings all,

Though it has yet to be posted on the QRZ.COM website,
according to the F.C.C., U.L.S. I am now KG4JBM, having passed
my Element 2 exam a week ago. This happened at the Berryville, VA.
Hamfest. I went with my Elmer, W3HXF who waited patiently while
3 VEC's handled 60+ testees (A*very* long process).

Although I had/have an Elmer, I would really like to say how
much I appreciated all the advice and encouragement I've received
on this ng. Now it's on to Elem. 1&3 ! Only then can I really begin to
enjoy what brought me to Ham radio: The HF.

Several of you recommended various projects and/or quality
kit manufacturers. Some also endorsed picking up a boatanchor,
just to get on the air. My choice may or may not disapoint you; I found
only one kit brand on sale there and that was the Ramsey line of QRP
kits. If the Ramsey name makes you cringe, well, at least my heart was
in building-- not buying. The kit I bought was the Ramsey 40 meter CW
QRP transmitter. I suppose right now my trusty RS DX_392 will have to
serve as my receiver. Though any of you could build this kit in 2 hours
or less, I've dragged my feet as I don't have the legality to use it as yet.
I hope to have my Morse and Gen'l before the end of the month.

There are some things I could ask your advice/help with:

Power Supplies.

Well, the manual with the kit says I want something in the range
of 12-15V, producing around 450mA for approx. 3/4W out. What
I've got is a 13.8V 2.5amp power supply. Is this going to fry my kit or
self-oscillate my amplifier curcuit until my transistor cooks? The unit in
question is an old RS regulated power supply. I see no way to "vary" it.
The kit manual says, " A power supply or battery capable of 500mA is
required." Note Here: The 'net is crawling with receiver and transmitter
designs, but try to find one on power supplies. Peter Parker lists one but
tells you , " Beware, if you build this wrong your pubic hair will fry off ! "
[HHOK, Peter] I guess everybody just buys their P.S. from Radio Shack!

Xtals

The kit comes with a 7.040MHz xtal but can take another and a
front mounted switch is included. Anybody out there have a spare xtal that
they'd send to me?

Mods

If you know this kit,.....Super incredible mods that any newbie can do and will result in guaranteed WAC awards like you've never seen. Well anyway, if you know the kit there might be improvments u could pass on: Maybe how to tolerate that 13.8V, 2.5A P.S. for instance.

Thanks very much to all of you,

Andrew
KG4JBM

Source record: 58519

Then why would you use AM or FM?

With FM as long as the HT receives the signal, there will be not change in the audio signals level, regardless of the received RF signal strength.

The commercial tracking units emit a 1/10 second CW pulse every second. Their battery life is 3 days of continuous operation on button cells. Size is approx. 1/2" in dia. 1 1/2 inch long. Verified on the ground, in the dirt range of 3 miles. They typically use a single transistor circuit and a 3rd or 5th overtone crystal.

Here check this out:

http://homepages.go.com/homepages/j/b/g/jbgizmo/page4.html

Loose the FM HT.

Buck:

Ever see or use one of those 'magneto' hand cranked phones? (I've got two of the big old wooden ones.)

When you turn the handle coils are rotated within the field of a permanent magnet. The faster the handle is turned the higher the frequency of the AC generated. The alternating voltage generated could be up to 120 volts open circuit, frequency dependent on the rate of rotation..

If there was a short on the telephone line you sometimes could hardly turn the handle at all!

Many military 'field' telephones (all nationalities) use/used the same ringing system.

As a previous poster mentioned ringing voltage in many/most North American telephone systems; i.e. the alternating voltage coming from the central telephone exchange to ring your telephone when somebody is calling you, is usually 20 hertz (cycles).
Most telephone sets were/are not too sensitive to the ringing voltage frequency; for example I am familiar with one system that used telephones nominally designed for 20 hertz for many years with a ringing frequency of 33.3! Most phones don't like 60 hertz however but will often vibrate and/or tinkle, or even ring continuously, if your telephone line happens to get crossed up with 60 hertz power!

However there were and possibly still are some telephone systems that use different frequencies.
A system developed, I believe by Automatic Electric in Chicago, for example, provided up to five different frequencies, for party lines. The telephone sets were 'tuned' electrically and mechanically to vibrate and ring only when the appropriate frequency for that party was sent out by the telephone exchange. The advantage was 'secrecy of ringing' other

parties on the line wouldn't know someone else was receiving a call unless they happened to pick up the phone while ringing or conversation was in progress.

With five frequencies up to 10 parties could be served from one line, all with secrecy of ringing, by connecting five ringers from one side of the line to ground and five from other side of line to ground. This ten party system was not used in many areas because high soil resistivity made it extremely difficult to get a good ground connection. One system I am familiar with used only four frequencies; with the ringers connected across the telephone line pair to provide up to four parties on one line.

The expression "Share the time on your party line was commonly advertised". A disadvantage of what was sometimes (incorrectly) called "harmonic ringing system" was that the telephone companies had to stock and maintain phones and ringers for five different frequencies. I seem to recall that typical ringing frequencies were. 16.6, 25.0, 33.0, 50.0, 66.6, hertz? In some cases motor driven AC generators produced the four or five ringing voltages. With input voltage variation to the motors, especially if the motors were DC and supplied from the nominally 48 volt central office exchange batteries, it was sometimes a devil of a job to keep them on frequency!

In many rural areas of North America, magneto phone systems were used beyond the 1960s (maybe even today?) and as mentioned the ringing frequency would be dependent on however fast you turned that handle.

One advantage of the magneto system was that it did not require AC electricity. All talking voltages came from 'S' type 3 volt dry cell batteries which lasted for months/years. Ringing voltage came from cranking that handle. Thus even the small manual switchboard that served as the telephone exchange (Central) in many small North American communities could continue operating for days without AC power. With a kerosene lamp on top of the switchboard; hard on the operators wrist though, ringing all those calls through by hand sometimes on lines that sometimes ran for miles through damp trees etc. During the cold war it was rumoured that magneto telephone systems with their simplicity and rugged construction would be the most likely to survive the magnetic pulse destruction of thermo nuclear weapons. Not that it would matter much!

Just thought I'd comment!

The power supply needs to be within the proper voltage range (12-15V)
and must be capable of supplying the *minimum* current of 450mA. It
meets both these criteria. You could use a 20 amp supply and the
transmitter would only draw 450mA. You would not want to use a supply
rated at less than 450mA or the transmitter would cause the supply to
overheat or shut down if it has built-in current limiting or
protection.

If it's not a mono screen, one or more of the pins or wires in the data cable (the one that plugs into the vid card) may be damaged or broken. Only cure for this is to replace it.

Seems to me a friend of mine acquired the contents of an overwater emergency kit
from a Martin 404 when the entertainer who owned it upgraded to a De Havilland
something or other. Well, after cranking the transmitter we decided to see what
would happen with the balloon thingy and placed it in sufficient water. It
promptly inflated itself and took off trailing the antenna wire, which dragged
across a nearby set of utility lines and killed the power for the block.

Hello there,

I have Russian radio tubes for sale. All tubes are never used
and 100% tested.
GI7b - 25 USD
GS31b - 50 USD
GS35b - 75 USD
GU74b - 75 USD
GU84b - 85 USD
All prices above are for a single tube and without shipping price.
Discounts are possible for the pair or more tubes.
For more information please mail : r.vaicius@omnitel.net

Cory,
You find somebody with an older Motorola Data book. All three are in
the 03/91 DL110 REV4 RF Device Data Vol 1 for example....
Motorola are really unhelpful (for the homebrewer at least) about
deleting data as soon as they think the devices are obsolete, they would
prefer you to buy the newer types....
If you can't get help from your .edu library I could help out but I have
not got access to a photocopier and have to pay Kinko's prices.

MRF476 is a 3W 12V CB job
MRF449A is 30W 12V 12 dB 30 MHz
MRF421 is 100W 12V 30 MHz 10 dB

The best place to start looking for circuits is in the Moto application
notes.

Source record: 58463

tnx fer reply,
I soon discovered that my question was inaccurate so I hurried up to
delete it few minutes after it was posted.
I found some data for IRF630, but the problem is that it is good for
higher current, while it is not so easy to see the variation in gate
voltage from 0-3V and respective drain current. I am interested in
figures for up to 0.5-1A

Perhaps it is the wrong device for the purpose, but it is available,
in fact I got several hundred devices for free at recent VHF meeting

Look into some of the Analog Devices logamp chips (search for
"logarithmic" or "logamp" / "log-amp" at http://www.analogdevices.com).
They're pretty nifty. This is one of those tasks that used to be a huge
pain in the butt before the IC designers turned it into a solved
problem.

If I remember right, AD has some inexpensive chips that will give you
120 dB of dynamic range with proper layout.

Hi!

I'm about to embark on building a 160m only 2 x 813 tube linear !
I could really do with a CCT diagram, any chance you could email me a copy of your article please ?

Also, I've never built anything with valves before so any tips from your past experiences would be appreciated!

Cheers!

Myron I think you are correct.
I recall those balloons also in 'Surplus' sales after W.W.II. Maybe it was the British ones that used a kite. That braided fabric and copper (or bronze) beautiful stuff. Something like that was also used with the T1154 and R1155 in British bombers such as the Lancaster as a 'Trailing Wire' flying antenna.
Anyone got an idea about the hand generators?
Summary.
1) Mentioned for sale: Don't know what they are for.
2) Assumption/Suggestion they were/are telephone ringing hand generators. (Long boring diatribe on telephone ringing by myself).
3) New suggestion that they are/were part of 'Gibson Girl' emergency hand cranked radios. (Thanks for explanation of 'Gibson' by Brian McAllister).
Terry S.
PS. We could start a new thread entitled "War surplus I remember"!

No.

Not quite the same analog, but just because your car is CAPABLE of travelling at 127 MPH does not mean it WILL every time you start driving down the road. Your PS is CAPABLE of providing up to 2.5 Amps, but will not FORCE the radio to 'swallow' that. The radio will draw what it requires from the supply, which will be loafing along.

Look at the Maxim MAX232 IC.

The if232c is nothing more than a level translator. It takes TTL signals
and converts them to RS-232 and vice versa.

I think Kenwood used a 1488 and 1489 transmitter and receiver chips to
accomplish the same, but the Maximum chic combines both functions in a
single chip that requires 5 external components at most. Some of the
derivatives (Max 203 if I remember correctly) require no external
components...

Hope this helps some..

Do a search on the QRZ and Hamcall sites under the radio mods section. I
think you will find a complete circuit there at on of those sites.

Hi! I am considering building a simple homebrew CW transmitter but my constraints are such that antennas have to be indoors and therefor proably not very good. With that in mind I may have almost no succes at true QRP (running of a magnetic loop antenna inside an apartment) I've had fun with QRP outdoors with good antennas, but inside I'm going to need a but more kick. With the 20-50W I estimate I'll need I am thinking of tubes, possibly even a simple hartley or colpitts oscillator.

Does anyone know of a design along these lines? I have searched the web but have found nothing entirely fitting so far. I would rather have a homebrewed station, honestly and I would like to experement with tubes for the first time.

Thanks in advance for replies.

Hi Jonathon,

The ARRL Radio Amateur's Handbooks contain many articles for tube-type transmitters. Check all volumes up through about 1980 or so. I plan to build a 35 Watt 80m/40m CW rig with VFO based on a 1980 Handbook article as this winter's transmitter project.

Another great source is "104 Ham Radio Projects for Novice and Tech-nician", TAB Books, 1968. This one's a bit harder to find, but it's chock-full of great transmitter projects. I own a copy of the book and have built several of its rigs.

I don't know if you live in a large metropolitan area or not, but if you do, check your big city's main public library and see if they have any older Handbooks that you can check out. Also look for the old "104 Projects" book.

I have several homebuilt tube transmitters (known in the ham vernacular of today as "glowbugs") - check the pictures on my web site. My big 65 Watt 6V6/807 rig is a lot of fun to operate.

73,
Dean, K5DH

The simplest tube transmitter is a crystal oscillator directly driving the antenna. A typical one was found in "How to Become a Radio Amateur" in the late '50s thru mid '60s. It used a 6DQ6 sweep tube and was good for about 25W as I remember. Using a high gain sweep tube as a single-tube transmitter is probably the best choice since it should result in the lowest crystal current for a given output.

The next step up is the two tube MOPA using an untuned (RF choke plate load) xtal oscillator stage driving a PA tube. Video output tubes like the 6AG7, 6CL6 and 12BY7, as well as the 5763 RF beam power tube, were considered the best oscillator tubes. The PA could be just about anything: 6L6, 807, 6146, 6DQ6, 6DQ5, etc (the 6L6 is the original and still champion beam power tube, the numbered tubes are common transmitting beam power tubes, and the last two are sweep tubes)

A slightly more complicated arangement uses a tuned oscillator output. This gives more PA drive as well as the ability to multiply your crystal frequency, but it generally means that you'll have to neutralize your PA, unlike in the untuned oscillator case.

There were tons of plans in the handbooks and other literature of the time (pre '70s). Here's one website that has lots of plans and links: http://home.cfl.rr.com/happysurfer/hamlynx/hamtube.htm

If you have a more exact idea of what you want to build I expect we can find some plans for you. When you say you haven't found anything entirely fitting so far, what are you looking for that you're not finding? Do you have any tubes you're thinking of using?

Don't forget that you'll need to build or buy a power supply. A single supply giving 300-350V would be good, depending on the output tube (in particular, the maximum plate current rating), for as much as 50W input (assuming of course that the transformer could supply that much current). Alternately you could build a dual-voltage supply with say 250-300V for the oscillator and PA screen (some tubes can't take that much screen voltage, so you'll need to lower it with a dropping resistor or resistive divider), and 400-750V for the PA plate. There's an easy way to get both voltages out of a single center-tapped transformer using a bridge rectifier circuit. Always eep in mind that these voltages can be LETHAL!

73,
Mike, KK6GM

Hi Jon,

I live in a white apartment building (no outside antenna, please) but I have strung white wire wrap wire right next to the to the building and my land lord has yet to see it (he passes with in a few feet of it twice a week when he mows the lawn).

Anyway my station is 100% HB and 100% tube. My transmitter is a rock bound 80/40m with a 12AX7 oscilator with a 1625 final. The 1625 IMO is the most bang for the buck PA out there right now (I get about 60 watts output). I get mine for about $3 - $4 each. I got a lot of information from a 1967 copy of The ARRL Amatuer Radio Handbook but I also got a lot of practicle information from these guys.

http://www.geocities.com/CapeCanaveral/Hall/8701/hamfiles.htm

http://www.qsl.net/n6ev/Glowbug.html

http://hem.passagen.se/sm0vpo/

These are the sites I go to again and again for project ideas and practicle circuits. The last one (Harry Homebrew) has a lot of infomation on apartment antennas.

Good Luck and welcome to the world of tubes. If you have any questions just post them here. I got my station up and running after a LOT of help from the guys on this NG, once again, thanks guys.

I don't know if any are available up there anymore but the easiest source of low voltage high amperage transformers were old S-100 computers. 6.3 volt at 80-100 amp supplies were common in those boxes. That way they could provide the 8 volt power to the cards that was regulated down to 5v. All that ttl and nmos memory really ate current.
thanks, John.

1799. Novel NiCad Charger - will it work?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-18 00:00:00 UTC
From: baja_az@juno.COM
Message-ID: <20000818.103921.7839.7.baja_az@juno.com>
Source record: 58479

JW <jdwalton@home.com> wrote:

> Electronics World published a NiCad charger circuit in the
> current issue [...]

> What are the potential drawbacks of the system described
> above?

Ken A. Nishimura, KO6AF, has written a relatively definitive treatise on nicads, entitled, "Some Ramblings About NiCd Batteries." The casual title is deceptive - the article provides a very good overview of the technology, construction, chemistry, features, pitfalls and charging of nickel cadmium cells. The "memory problem" is discussed as well. Some coverage is also given to nickel metal hydride cells.

The article starts off with this teaser:

> Credo #1: Charge control is the key to battery management.

Ken discusses the consequences of using a charging rate that is too low or too high, and how to precisely detect when a cell is fully charged.

I have the 1994 version (about 34 KB of ASCII text), which includes a short appendage of "peer review" comments and excerpts from a GE technical note.

There may be a more recent version; I haven't had time to track down Ken and ask, although it is "on the list." (I would hope that he could do a follow up and add comments about pulse charging.)

In the meantime, though, if anyone is interested in the 1994 release, it can be obtained from the TANSTAAFL BBS via Internet as follows:

These sound like the GN-42 used in TA-43 and TA-312 field phones, the
extra terminal is for the internal switch which disconnects the phone

when the generator is cranked. Many of these were made by Kellogg/ITT
and Radio Mfg Corp.

Hi ,
as the subject suggests I am chasing a schematic for the kenwood if232c
computer serial interface.
I'm loathe to pay the dollars for the kenwood item over here in vk land so
if anyone can help me out it'd be great...
Thanks

I think that it's the AD8307. Make sure that you look at the ap notes because this device isn't as straightforward to implement as it would appear from the *.pdf file. It's also important to be very mindful of noise with log amps since a little bit goes an awfully long way.

Don Pease has an entire article on "What's this log stuff anyway?" on the EDN website.

Over a narrow range, the true RMS converters from ADI have a log output which can be used as a dB output also. You will need to temp compensate the output however. Look at the ap notes. I just finished using one in an analytical application. They are about $16 now, however -- the prices have really spiked up in the past few months for these chips.

Lastly, look at the Nat Semi ap notes on log converters - you can implement one with a pair of transistors and op amps - again you will need temperature compensation, however.

Geez, Mike, when I was a young lad we were allowed a mere 10W DC input
to the PA!

Have things changed? No. A lot of DX was worked from the UK running a
hell of a lot more power than you could get out of a couple of 813s. Why
don't you raise your sights a bit? Never worked moonbounce on 160? Go
for it!

Ian.

PS. Don't shoot me for the top-posting. Just following the trend.

UK Vintage Radio

Visited an OB yesterday and bought some douzens of his valves, one was
6J11, but I can't figure out what sort valve it is,
seems to be multiple section type (the reason for the many pins in the
socket?)
tried http://duncanamps.com/tubedata/partsearch.mv but not much luck

any suggestions?

Hi Ian!

Well a friend of mine says I can get a full 400w on 160m from a pair of 813s, so why
would I need more ?
He says it would be a simple job to build an 813 based 160m amp, since it's my first
valve project I need to shoot a little on the low side :_))

Got any CCT diag's ??

Cheers!

MikeT ...

For Sale:

I have a small quantity of general purpose Microcontroller Bare Boards
for 8051/52 family. 4 1/2 by 7 inches, Double sided, plated through epoxy
board with solder mask both sides and top side component silk screen.
Routed with Orcad software. Board assets include:

1. 40 pin cpu site---any of the 8052/52 family.
2. MAX 691 Supervisor Chip
3. 27C512 eprom site for 64k program memory
4. 43256 32K static ram site
5. 2864 EEPROM site
6. MSM 6242 Clock Chip
7. 8 pin Serial EEROM site
8. 40 pin 2X20 IDP connector site for demultiplexed Address/Data and
control bus for IO expansion
9. Numerous on board test points identified via silk screen with site for
on-board reverse polarity protection diode
10. Site for Tadiran "AA" sized lythium back up cell for on board clock

Comes with bill of materials list and Orcad print of unit.

$23.50 each....post paid first class conus

tnx for the read

From: LA8AK@online.no
Message-ID: <399e8e35.151340628@news.online.no>
Source record: 58492

Need to find data for variation in emitter-base forward voltage drop
for Power Darlington Device? A 10-50W device seems useful, need less
than 1A collector current

My Motorola library doesn't show such on voltage curves

I need it to compare between use of darlington and mosfets in simple
bias voltage regulators for RF power amplifier

do you know a specific url showing a darlington device which has
emitter base voltage displayed?

1824. Re: Emitter-base forward voltage drop for Power Darlington Device?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-19 00:00:00 UTC
From: tom_bruhns@agilent.com
Message-ID: <8nmboq$158$1@nnrp1.deja.com>
Source record: 58496

It seems like you should be able to get that from a theoretical analysis. Bob Pease recently devoted one of his "Pease Porridge" columns in EDN magazine to BE voltages. If you assume that over the operating region, the base currents in the two transistors remain in essentially the same ratio, that should let you figure it. I believe his columns are on the EDN web site, if not on Bob's own site at National Semiconductor. -- Or...simply measure one. Presumably it would depend on the Gm of the FET you were comparing against. Some of them turn on pretty quickly, though in general I'd expect the transistor DC drop to be lower, even a Darlington-connected pair, at under 1.5V anyway.

Cheers,
Tom

1825. REQ: 30M or 20M QRP Transceiver Project

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-19 00:04:19 UTC
From: "Mr. Mister" <kld68@my-deja.com>
Message-ID: <8nkitp$607$1@nnrp1.deja.com>
Source record: 58482

I've poked around the web quite a bit looking for a good 30M or 20M QRP transceiver project. I've mostly found projects that were "rock bound" or used obscure, hard to find parts, or were dubious looking hand drawn schematics.

I'm looking for a project which has some frequency agility, preferably VFO tuned, that uses readily available parts, and that has a good chance of actually working once built. I'm not opposed to winding toriods, in fact I expect to.

I realize that there are several kits which fit this criterion, I've even built a few of them. But, I'm looking to build something more or less from scratch just for the fun of doing it.

Any suggestions?
Thanks!

Looks like Ive got a lot of reading to do before getting started, for certain. TO be more precise, the designs I had been seeing either looked way-unstable (single tube Hartley osc), over complicated for me, or underpowered. But I have a lot to learn esp when it comes to the power transformers. For tubes I was planning on 6L6s but I can branch out and get whats necessary.

One very dumb question from someone used to PCboard I have always wanted to ask.. I understand point to point, since its sortof like a precursor to dead-bug construction.. but what is used for the ground? Usually its not the chassis so I wonder about that.

Also, can ceramic variable caps be used in place of air variables? Thanks!

Check out the page 30-26 in 1993 ARRL handbook. You can find the board drawing on the back of the book, so you can build this from scratch. I made those boards for myself and will build it soon. I should be a fun project and it should be a good one to you as well. Hope this helps.

1829. dj-v5 programming cable/protocol (dj-195?)

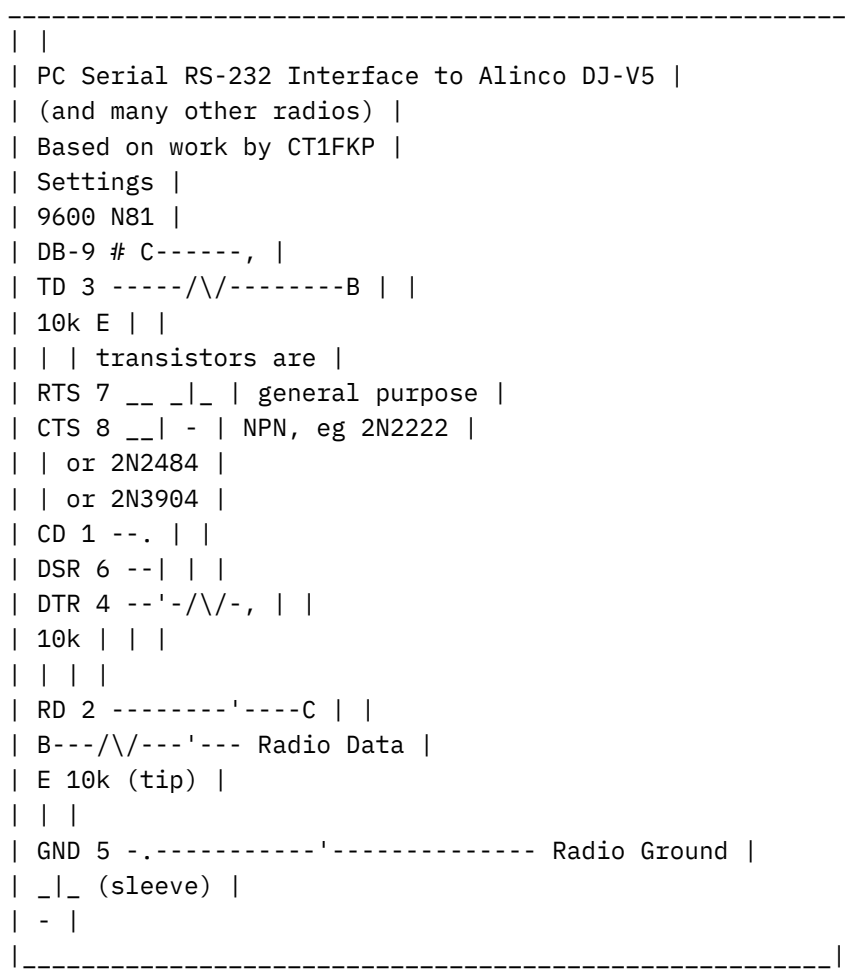
Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-19 04:14:05 UTC
From: Zsylvan+noZs_0008@cyberhighway.net
Message-ID: <8nl1id$nt1$1@news.cyberhighway.net>
Source record: 58485
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Followups directed to rec.radio.amateur.homebrew

I'm slowly making progress deciphering how to connect the Alinco dj-v5 to a PC serial port. I want Linux commandline software, and both Alinco and RT Systems (who provides a cable and windows software) were unhelpful. FYI: http://www.rtsars.com/ Their package is for the dj-v5 and the dj-195, so maybe this cable works for both?

I've figured out a cable that seems to work. Very simple, two transistors, three resistors. It plays a few tricks.... :)

I don't know if it is compatible with the RT software since I have never seen their stuff. The following diagram must be viewed with a fixed-pitch font (e.g. courier) otherwise it will be a mess. It should appear enclosed in a box with aligned top, bottom, left, right borders.



As for the communications protocol, that's more difficult! :)
All I know so far is the sender init transmission sequence:

From sender prefaced with: >
From recver prefaced with: <
all lines end with carriage return (CR)

>AL~F0000W66008103000003020100001500011201
<OK

and when the receiver doesn't respond with OK quickly enough:
>COM ERROR

Does that look familar to anyone?
What comes next?
How does the receiver initiate the transfer?

I'd appreciate any help or encouraging feedback. :)

One of the most common lineups of the '50s was a 6AG7 driving a 6L6.
You can drive a single 6L6 to about 35-40W input (350-400V @ 100mA).
You can also parallel two of them for twice the current and power --
there was a 6AG7 / 2 6L6s rig in a mid/late '50s ARRL Handbook.

> chassis so I wonder about that.

Yep, the chassis was used for the most part, especially I believe with
the higher-conductance aluminum chassis. It was common to bring all
stage grounds (e.g. bypass caps) to a single point which was connected
to chassis, to avoid signal ground currents flowing in the chassis.
Many receiving RF tubes had dual cathode leads, with one being
connected to the input circuit and one to the output circuit. That way
the voltage generated by the cathode current flowing through the
cathode lead inductance does not get impressed on the input signal.
That's only the basics of a very complicated subject (I regard people
who really understand "ground" with a certain awe...).
>
> Also, can ceramic variable caps be used in place of air variables?
Thanks!

Some smaller rigs used compression trimmers for the PA load capacitor
(a high-value, low-voltage cap), but that's about all I've seen, other
than feedback adjustment trimmers in oscillator circuits.

1832. Which ferrite for 30 MHz transformers?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-19 04:57:26 UTC
From: Cory Papenfuss <papenfus@juneau.ece.uiuc.edu>
Message-ID: <Wson5.1276$9N1.22105@vixen.cso.uiuc.edu>
Source record: 58488

I've been trying to cook up a linear amplifier for 30MHz out of
two MRF449A transistors. I've looked through the motorola appnotes
extensively, but I cannot get a good impedance match on either the input
or output transformers. When I wind a 3:1 or 4:1 (9:1 and 16:1 Z)
transformer, I can't get enough capacitive reactance to match the input
and output of the devices. Just about everything I put on the
transformers (including capactitors in the 30-1000 pF range) aren't enough
of make it look like a match to the 2.4-j1.2 input or 2.1-j0.2 output of
the transistors. The best I can get is 2.0+j6 or so.
I've tried different ferrites, primarily material 43 and 73.
I've been using a network analyzer to read the impedance on the low-z side
with and 50ohm dummy load.

Any ideas?

-Cory

Source record: 58416

Hi - I built one of those back in the late 70's. It had a National Semiconductor CPU (don't remember actual number) FAR from being a Z80. When the kit arrived, I assembled it, but it did not work. So I returned it to England (from Norway) for service; when it came back they had added ONE wire which was not mentioned in the manual. But now the thing was working. Splendid & Exitement! :-)
The next day I was to show the thing off to my fellow school-buddies, but happened to put the 5 volt supply THE WRONG WAY!!!!!!!!!!!! Bad bad bad thing to do. I was in a no good mood for many days after that. The CPU was fried, and the ROM and some of the other chips too.

This is why I never learnt machine code on that prosessor.....

(But later I built a copuple of Cosmac Elf's - around the CDP1802 CPU. Those thingies were MUCH more fun than the latest Pentium.....)

TRIAD Power Transformer with 115V Primary.
Has Secondaries of 1000V at 300 mA, Two of 6.3V at 6 amps, plus 5V at
6 Amps. Potted. Good condition. Will sell for $65.00

Plate Transformer, 120/240V AC primary, with secondary of
4160 V at 120 mA (500 Watts) Will sell for $85.00

The following are all for 115 or 120 V AC primaries:

4V at 50 Amps - will sell for $35.00

5V at 14 Amps TRIAD - will sell for $40.00

6.3V at 13.5 Amps. 115V primary. Will sell for $36.00

6.4V at 50 Amps (S) Will sell for $75.00

7.5V CT at 8 Amps. (M) Will sell for $25.00

7.5 V at 46 Amps. 120V AC primary only. Will sell for $82.00

7.5V CT at 51 Amps. Will sell for $95.00
(Has 115V AND 230V primaries)

10V at 10 Amps (M) Will sell for $32.00

10V at 15 Amps. (S) Will sell for $39.00

Many other types available

SHIPPING IS ADDITIONAL ON ALL OF THE ABOVE.

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!
-
All potential buyers should be warned to steer clear of this company. They have a repeated pattern
of ripping people off and ignoring requests for support.
-
I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may
have gotten lost) and in both instances, never got a registered version of the program and all of his
emails were completely ignored.
-
I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very
quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them,
only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have
a working version of the program by the close of business that day, that I would challenge the credit card
charge. Magically, the code arrived several hours later.
-

1845. Need help with Delco radio

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-20 00:00:00 UTC
From: sefritts@bellsouth.net
Message-ID: <39a01e23.1340084@news.lig.bellsouth.net>
Source record: 58425

Hi all,

I have a Delco radio from a 1990 chev...I would like to use this radio
for AM dxing as it had an excellent reciever when it was in the car.
Can anyone tell me the pin outs on the back where the
electrical/speaker plug goes in? I want to use 12volts from my astron
and headphones for speaker.
Thank you for any help.

Stev

1846. Skin Resistance in a Transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-20 00:00:00 UTC
From: AMDX <AMDX@worldnet.att.net>
Message-ID: <CjVn5.5045$%O6.337801@bgtnsc05-news.ops.worldnet.att.net>
Source record: 58426

If I have 1 ohm of calculated (skin effect) resistance in 3 ft of wire
and I wind a transformer with that wire, will it still have 1 ohm of skin
effected resistance inside of a ferrite pot core.
In other words, will the magnetic field in the pot core alter the current
distribution in the wire?
The use is in a high gauss, high power application.

Thanks
Mike Knowlton
Panama City Fl.

Is there any way to elliminate the static generated from a
muffin fan? I installed a 12v DC muffin fan in an enclosure
I use to house an SSB rig and power supply. Keeps everything
cool, but generates about an S-4 noise level.

Thanks,
Dave

Does the fan have brushes? They make 12 VDC fans that have an electronic controller and the motor is AC - that might produce less noise. Other than that, try an electrolytic and a paralleled ceramic capacitor right were the leads exit the fan. Try to determine how the noise is getting into the receiver, via the antenna, power lead, or thru the case.

1852. Re: Static from fan

Newsgroup: rec.radio.amateur.homebrew

Source record: 58432

The first thing I'd do is wind both power leads, together, on a ferrite toroid core. I'd use around 10 turns and any of the 70-series ferrites, or type 43. Do this as close to the fan as possible. This technique solves an amazingly wide range of EMI problems.

This will take pretty good care of common mode problems, which are commonly more severe than differential mode ones. If there's significant differential mode radiation, the ceramic bypass between conductors right at the fan should help.

Roy Lewallen, W7EL

Check out ten-tec for the capacitors, there 40 to 500 pF and rated at
3.5 Kv. These are the same capacitors they use in there high power
amplifers and legal limit antenna tuner. The cost for the kit is $39.00
each. the kit information is http://www.tentec.com/tkit.htm Kit no
1207. You can buy two for your tuner and it will work just fine.

High harmonic output is a sympton of too much bias (not enough idling current). Excessive bias will also distort the waveform because the transistors are not in their linear operating range. You may be running class C.

You didn't mention what the idling current was or the base voltage. Are they what they are supposed to be?

> distribution in the wire?

Yes. What you will have is commonly called "Proximity Effect" which tends to squeeze the current away from the wire surface areas which are adjacent to other turns. The net result is an increase in effective wire resistance above what you would calculate based solely on skin effect. It is difficult to accurately calculate the contribution of "Proximity Effect" to the total wire resistance since it depends on winding geometry, and current level in the wire. There are formulas to calculate a rough estimate, but for precise work you would have to use some very expensive Finite Element Analysis software.

For a small pot core transformer I would just go ahead and build the thing to try it out. Then if it gets too hot, then worry about it. In your case the extra losses due to "Proximity Effect" may not amount to very much. You just mite get lucky.

Sounds like you are having problems with high frequency compensation for the leakage reactance of the transformers. Philips Semiconductors has 3 good applications notes on HF transformer design and compensation methods in PDF file format. The URL for the page with their collection of application notes is:

http://www.semiconductors.com/products/all_appnotes.html

You want ECO6907, ECO7213, and ECO7703. They also have a lot of other VERY interesting application notes for HF, VHF, UHF, and microwave amplifiers too!!! Check them out.

Yes replace it. I have used many a muffin fan, both AC and DC, none of which ever caused a problem. If the fan motor is the source of radiated noise line filtering will probably not cure the problem.

things like miniature video transmiters, microphone preamps and
now I am trying to get a two meter power amplifier to work, seems the
compression trimmers are to low in capacitance, it just seems like it
should have worked by now!
there is nowhere near the 10 to 20 times gain it's supposed to get, it
just seems like the transistors are defective.
When I send things back they want a minimum
of 20-30 dollars to fix it, then with out sending my money back or any
repair they leave me up a creek without a paddle.
Once they even complimented me on my soldering of surface mount
components, then
said they couldn't fix a kit because I had made
modifications,.... since when is adding the proper wires and bypass
capacitors just to get it to work modifying?
Does anybody know anything about this kit?
PA-1 two meter power amplifier.
I am not complaining, I am just wondering if
any one else has had similar experience with
this company.
The only reason I order from them is they sell
kits no other company sells.

I didn't know what single newsgroup to post this on; please forgive the multiple groups.

Ever since I bought the car (a 1993 GMC pickup), there was a pulse-type digital noise audible on the AM receiver which raised the noise floor by 10-20 dB. Maybe more. AM DXing was out of the question, and even in-city listening was frequently not possible or at least annoying.

A few years ago, I tried removing the antenna to clean corrosion on the ground connection to the truck body. This seemed to me to help. I would guess that I may have lowered the offending noise by 2 or 3 dB.

More troubleshooting over the years led to the discovery that the coax from the whip to the RF deck (mounted low in the dash approximately mid-cab) passed right behind the behind-the-glovebox computer. I guessed that this was the pickup mechanism, so I put several of those split ferrite cores around all of the leads in and out of the shielded CPU box. But this didn't work at all.

I left it alone for a few years, and then last month something got into me to try one more time. I located the coax coming into the RF deck, and I took all of those split ferrite cores that were doing nothing and clamped them right over the coax cable where they entered the RF deck. I was able to fit four or five of them onto the antenna cable before my fingers just ran out of room trying to reach up into the dash. This worked so well that I took a long drive just to hear what the radio was doing! The receiver was so quiet it was astonishing. AM DX is now a definite possibility.

Many of you will recognize that essentially what I did by using the split ferrite RFI suppressors is construct a kind of a W2DU balun. I posted this in the hopes that some of you suffering RFI in the car will benefit from this. Good luck!

R,

Al W6LX

?! Hmmm, strange. I just checked the info I provided against the fileserv reference data and it is correct. That's how I snagged the nicad file. Don't know what to say. Maybe something like, "Systems are inherently reliable until you depend on them."

Apologies to all for the inconvenience.

Many thanks to Sylvan and AC6V for their informative and helpful followups.

This maybe a stupid question, but are you using transistors with "matched"
Beta's (i.e. current gain)? Bipolar transistors with the same part number
can have a fairly wide variation in current gain. You need matched
transistors for the even harmonics to cancel out in a push-pull amplifier
circuit. Then you use a low pass filter to take care of the odd harmonics
that are still present in the output.

On a headlight the wattage will not change, you can calculate the current draw with the known wattage. To read current you can buy a shunt from a surplus electronic store on the internet, the meter will be a little more difficult to find but you can find one, or you can buy the one you want from Triplett for about $60. The best way to make a "load" is to use high current transistors like the 2N3055 and make sure you use a good piece of heatsink, somewhere I have a schematic on how to do this.

It sure looks like you are complaining. That said, I must say that
Ramsey Electronics kits are usually a "learning experience." Having
built a few kits from them (and helped a friend or two with theirs) I
have found enough bugs and glitches that I don't recommend them for
first time kit builders.

Most of the problems I find are just as you describe: poorly selected
parts, lack of robust decoupling from the Vcc and/or Vdd supplies, and
generally cheap design practices.

>The only reason I order from them is they sell
>kits no other company sells.

--then you must not be looking very hard. There are plenty of
reputable kit manufacturers out there. John Ramsey's kits are
inexpensive for a reason...

I would think that too much bias ==> too much idling current. I
have messed around with the bias in any event and I get the same thing
with 10mA-5A collector bias (Class B-Class A basically). I have also
attenuated the input power to see if perhpas I was overdriving them, but I
get the same waveform (only smaller amplitude).

I got both transistors out of the same lot and I've tested to make
sure the current gains were the same. In any event, a slightly mismatched
beta wouldn't produce *more* power in the harmonics than in the
fundamental, I wouldn't think. It might increase them slightly, but the
harmonics should be at least 10-20 dB down.

True, but I had to ask anyway since you did not say you had matched the transistors.

Another thought occurs to me, did you check the output waveform with a scope, and what does it look like? You may have both transistors biased the same, but the actual drive current in to the base of each transistor may not be even, and symmetrical about zero, which may show up in the shape of the ouput waveform. Or your output circuit layout is not symmetrical from each transistor's collector to the primary winding relative to "RF" ground. From what I have read the most critical area is the ground connection between the two transistors emitter leads. Then from that point to the input circuit, and the output circuit.

As a final idea too, do you know what flux level you have on the transformer core just from the bias current alone? I am assuming you are using a conventional HF coaxial transformer on the output. What I am thinking is the bias current flows from the collector of each transistor to the center tap on the output transformer (used as a DC return to the supply), which may have the core biased high up on the core material's B-H curve, so when you apply RF the core goes in to saturation in one direction. When this happens you have non-linear magnetic coupling from primary to secondary. That would be real good for harmonic generation. Remember a high mu core material will saturate very easily from a small DC current flow in the winding.

1882. Re: Bad distortion on homebrew HF pshpul amp

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-22 00:00:00 UTC
From: Cory Papenfuss <papenfus@juneau.ece.uiuc.edu>
Message-ID: <rnBo5.1633$9N1.27372@vixen.cso.uiuc.edu>
Source record: 58361

I know these are significant concerns, and I believe I've
addressed each of them. The DC rail busswork is very firm and the layout
is solid and symmetrical, with tantalum 10uF and 0.02 ceramic bypasses
where the RF ties in. The bias shouldn't be an issue for the
transformers, since I'm using modest permiabilites (material 43 (u=850),
material 64 (u=250) tried), and the bias current is small (100mA). The
output waveform doesn't look too bad (slightly distorted, and fuzz on it),
but the emitter and collector voltages are distorted significantly.

I'm mainly concerned with the differential nature of the beast, I
think. Since it's push-pull and I'm using a non-center-tapped input
transformer, when one side tries to drive one base with forward current,
the other would have to be pulled with reverse current. I've tried an AC
ground on the center tap in the input, but still the same thing.
Similarly on the output transformer, I've got conceptual problems. The
core I've built is something like this:

```
--------------
C1-=================|
-------------- |____Vcc
-------------- |
C2-=================|
--------------
```

...with the high-Z windings in the middle of the copper tubes.
When one transistor pulls one side down low, it induces voltage in that
tube's high-Z winding, but the other side is highly inductive (by design).
It seems that this shouldn't allow much current to flow, and maybe the
impedance is too funky for the transistor to drive.

I checked out a reference design in my old Motorola RF transistor data
manual. It would seem that your bias current is way too low.

Ic= Collector current, assuming an efficiency of 50 % and Pout of 50 watts
is:

Ic=(2 x Pout)/Vcc

Ic=(2 x 50)/13.8

Ic=7.25 amps

Motorola recomends the bias current be set at Ic/hfe. The data sheet for the
MRF449 spec's a min hfe of 10. So your bias current should be set for:

Ibias=Ic/hfe

Ibias=7.25/10

Ibias=0.725 amps total, or 0.363 amps on each transistor's base lead.

If you want I can fax you a copy of the design note. You can reach me by
E-mail at kc8ldo@arrl.net.

with the odd input (non center tapped) perhaps this is now what used to be
referred to as a Push Push multiplier?

Just a thought.

Ttake a punched perfboard and use it as a punch guide. keep the punch perpendicular (a much harder task than most folks think and the reason drill patterns drift all over the place. A precision machinist once told me that the center punching process is the most difficult part of a non CNC driven process. The machinist suggested that folks have built or buy a precision punch assembly which is basically a block of steel with a precise hole machined(drilled) with its center scribed on the sides. A punch which has been machined to fit with no slop in the hole in the machined block is the next item. Then all you have to do is move the steel block over the work's scribe lines, line up the block's scribe lines (X and Y) with the scribe lines on the work, insert the punch in the precision hole, tap the punch oh so gently with an itty bitty brass hammer and presto!! you have a precisely positioned center punch dimple right on the spot of interest and one that wont drag your tiny drill bit off center. Repeat this step for all the holes as needed. This procedure assumes that the metal smith has taken the time lay out the work accurately. Machinist's layout blue dye is a real must for metal layout. Investment in a quality machinist's scale is another must. While the Dremal tool in a small press may work, you may want to look into a full sized drill press as sold by Sears and some tool import stores. A full sized floor standing drill press with a quality chuck and precise Quill bearing can be had for under 300 dollars complete and ready to go. This process works and if you practice a lot you could probably ingest a brew or two without too much degradation in the work's quality.

Good luck.

Last time I tried through-hole mounting, the center punch actually made
things worse. It seems to work harden the copper in the area you want to
drill, and makes the drill wander away from the desired spot. The best
solution is to surface mount the parts and avoid drilling all those
darned holes.

How are you driving the spectrum analyzer? Depending on the model, more
than about -10 dBm at the mixer may cause all sorts of apparent
distortion. Make sure your harmonics and distortion products remain
constant when you trade off 10 dB of front-end attenuation for 10 dB of
IF gain.

I am working on a PLL circuit which requires serial data clocking, 3 wires: clock, data and Load enable. I use the IC manufacturer's software with the parallel port of my computer for programming. My digital storage scope shows me the signal which appears to be right but I notice some jitter between the clock and data signals. I have two computers, a new one and an old one and I am not able to make the PLL to work properly. I would like to use a device which used to be sold be a company called: RF Prototype Systems of San Diego. I am unable to contact them by mail or phone; they may have gone out of business or moved somewhere else.They use to have a device called : "Parallel to serial controler Board" I have a photo where I can see Dip switches and about 6 IC's. Does anyone know about this type if apparatus or similar for loading serial PLL's
Thanks. VE2AUC

1893. Bad distortion on homebrew HF pshpul amp

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-22 02:23:03 UTC
From: Cory Papenfuss <papenfus@juneau.ece.uiuc.edu>
Message-ID: <bulo5.1565$9N1.25765@vixen.cso.uiuc.edu>
Source record: 58350

I've been working with a couple of MRF449 transistors (thanks all
for the datasheet info before!) to build a 50W 20-30MHz amp. It's been
fairly consistent in its operation no matter what sort of ferrites/turns
ratios/bypass caps I've used on the z-matching transformers. Basically, I
can get 20-40W out, but it's distorted and has more power in the harmonics
than the fundamental (spectrum analyzer). I'm fairly confident that the
transformers are reasonable now, but the voltages on the bases are
freakishly distorted. I'm basically using a configuration like is in
motorola's AN762 and AN779 app-note, with a non-center tapped input
transformer (separate ferrite-choked bias feed for each transistor). The
output transformer is a double wires-through-ferrite-loaded-copper-tube
type for good coupling, with the collector DC coming through the center
"tap" on this beast.

Any ideas on what could be causing this? Impedance ratios are 3:1
and 1:4, which shouldn't be too far off. I'm almost thinking that the
MRF449 doesn't like being operated push-pull, but that'd be weird.

Thanks,
-Cory

You should realize that what you are trying to build will give you AM, which is used very rarely on the ham bands. Nearly everyone uses SSB, which you don't get when you use plate modulation.

The requirements for the modulation transformer are simple enough. You have to match the impedances, approximately, and be able to handle the power. You didn't mention the power level of the rig or its configurations so I can't help you with any of the numbers.

Just a thought, maybe the fact that you are getting the signal "off the air" as opposed to conducted to the load is getting you misleading results. You might be seeing a mixture of the input and output signals? Try making a sampling "T" connector (capacitive coupling) and routing directly to the spectrum analyzer through an attenuator pad.

Message-ID: <8nvtp6$lk4$1@nnrp1.deja.com>
Source record: 58379

Wow--I'm sure all that works just fine, but I'd go nuts trying
to get boards out if I had to spend that much time setting up
for each hole. I etch pads with 0.010" center holes in them,
and simply "bombsight" them in the drillpress. IMO, a
full-size drill press is worse than the Dremel for small
holes, unless you get a really precise one with no slop,
which you won't likely find at Sears. When I'm forced to
drill holes at home, I do it with a Dremel in a stand, but I
have access at work to a precision miniature drill press which
works much better, mainly because it has extremely little
sideplay between the drill and the workpiece. I drill lots of
#80/0.0135" holes; breaking drills tends to be a worse problem
than getting them in the wrong places. The times I've measured,
90+% of them are within 0.005" of the marked locations (else
I'd see etched hole area not drilled). It helps me a lot to
work under a magnifier and good lighting. Sources of cheap
carbide bits are helpful, too. (Try www.mpja.com or Harbor
Freight or Grizzly)

Cheers,
Tom

By the way, are the even harmonics much stronger than odd harmonics ?
If they are, this sounds that you have a push-push frequency doubler
instead of a push-pull amplifier :-).

Are you absolutely certain that the phase of all transformer windings
are correct, since opposite phase for one transistor in he output
transformer would create a push-push frequency doubler.

I'll give up sniffing solder fumes before I give up beer.

I made a template from clear plexiglass--I drilled holes in the
plexiglass using perf board as a guite. It's easire that using the perf
board directly--you can see through it and you can't get off line and
drill the wrong hole.

Source record: 58387

I have since tried going with an ac-grounded center tap on the
input secondary. The results are basically the same. When I look at each
transistor's individual base, the waveform looks fairly good on the
positive cycle, but on the negative part looks distorted, but shouldn't
matter since they should be cut off then. When I look at the two together
then, there's distortion that looks like perhaps the phasing between the
two is slightly off. I know the layout is symmetrical, and the
transformer action is working properly. I've tried attenuating the power
level in, and I get just a smaller, distorted signal :)
As far as the coupling to the spectrum analyzer... I'm just using
a small antenna to receive the radiated load energy. I know the signals
are coming from the amp though because when I run it non-keyed, I get no
power at the harmonics. I'd run it in directly, but I don't have a
high-enough power pad to attenuate it to something that won't blow the
front end of the equipment.
I'm almost to the point of just going with a Class A amp and
living with less power. Erg.

London Amateur Radio Club has another hamfest on the way. This is expected to be the biggest and best ever at out new location! Computers, radio equipment and electronics flea market. See the web site for more details.

LARC HAMFEST 2000
SUNDAY, SEPT. 24TH
9:00 AM TO 1:00 PM
VENDORS SETUP 8:00 AM
ADMISSION: $6.00, TABLES: $8.00

More details at http://www.larc.on.ca

You could glue a copy of the pcb on top of the perf board, if you can find a way of lining it up accurately.

1909. VT-4-C, What the hell are they?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-23 00:00:00 UTC
From: Rick Haub <rhaub@midwestmicro-tek.com>
Message-ID: <39A42F3C.AC75BD5E@midwestmicro-tek.com>
Source record: 58391

At a recent garage sale I went to I rumaged through the usual old clocks, books, baby cloths, and what not until I went over to a corner and there I found gold.

Two boxes of used loose tubes and some NOS still boxed. I'd say about 200 tubes of all kinds. I also saw an old Hitchcok (sp) tube tester that works. But the best was a box of transmitting tubes, 1625s, 811s, 813s, 8364s, and two VT-4-Cs. I bought the whole works for 10 bucks.

I want to get my general ticket this fall (got my novice last fall). I'm currently using a 1625 crystal controlled trasmitter on 80 and 40 meters, it runs about 50w output. I'm building a VFO to replace the crystal and would like to build an PA. The VFO is not costing a whole heck of a lot so building it was easy. But I was holding off on building an PA until I could afford the tubes for it. Now I've got 2 VT-4-Cs and I think they will do. The problem is that I cannot find any data on the web or else where for these tubes.

So, does any one have data on these tubes or know where I can get them? And the big question, does anyone have a design using them?

Thanks

Rick KC0GIX

1910. Audio modulation question

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-23 00:00:00 UTC
From: Rick Haub <rhaub@midwestmicro-tek.com>
Message-ID: <39A4319E.9C63A5E2@midwestmicro-tek.com>
Source record: 58392

I'm getting my general ticket this fall and I'm going to convert my present CW transmitter (I have a novice ticket now) to handle audio.

The transmitter that I build was based on a McCoy W1ICP design for novices. And it is close to a design that he published a few years later that was also for novices but included a way to add audio when the novice upgraded to general. I think I can modify the audio part of the upgrade to incorporate it into my specific transmitter. The problem is that I can't find the modulation transformer needed to interface between the audio section and the transmitter.

I was wondering if a transformer taken from a CB would work. Has any one ever tried this? I've got some old CB transmitters laying around so getting CB transformers is no problem.

Military number for a 211. An OLD (1930s) triode transmitting tube. Getting pretty scarce these days, as the "golden ear" crowd is using them in high-end power amps (along with 45's, 50's, 2A3's and 300A/B's).

Not sure, but they do seem to be the best-known people in the logamp
business. Their app notes also tend to be among the best IMHO. You can
probably get their parts from Newark or some other vendor at
http://www.findchips.com.

Hi again Jon,

Don't know if you're still looking for a simple transmitter using the 6L6 but you might try this:

http://www.io.com/~nielw/6l6/6L6.htm

It uses just a 6L6 and some caps and coils to get about 5-10 watts output.

If you use his power supply I'd use silicon rectifiers instead of the 5U4. The 5U4 and not cheep and can run pretty hot. But if you want to stick to period design.....

Here is a data sheet on the transistor in this
kit, based on my findings:

PH
BLW-40
m9531

ABSOLUTE MAXIMUM RATINGS

Ce voltage 9vdc
Eb voltage 5vdc
collector current..... 2 amps
power out ..... 20 watts (pep)
base current (quescient ssb/cw).... 10 ma.
power gain..... 10 db

If anyone can find the actual data, I would
appreciate it.

Do you really want me to complain?

I have given up beer since trying to drill those little holes on 0.100 centers for headers, ic sockets, LED's etc. Short of buying some sort of CNC outfit, has anyone a suggestion for acurately drilling on these centers. I am using a tiny punch to center the holes for my Dremel (mounted on a Dremel press).

When I lay out the pattern, I use rub on decals (Radio Shack) which, when etched will leave a hole in the center of the copper pad for each pin. This will act as a center punch guide for the drill. I chuck up the Dremel bit so that only about 1/4 inch is extending out of the chuck, this reduces bit wobble. It still ain't perfect, but headers and sockets fit fine. I would think it would drive you to drink rather than way from it.

I also have tried several of the Ramsey kits and while theyare not too pricey I feel that they are not worth what you pay for them. I built the 2 meter receiver and it never worked worth a crap.

Boy oh boy what ever happened to good old Heathkit. They might not have been the cheapest kits around but they were, in my opinion, well designed and had quality components in them.

Also even thought their line of kits is not very long, I also like the MFJ kits.

I like a milling machine and the small combination ones can be found used pretty reasonable, but if you want "fairly close in the neighborhood", get some perf board with the same spacing.

> I believe that was for the ClassA amp. I saw the same thing in the
> appnote I looked at, but then it said later that for Class AB, 100-200mA
> was all that was necessary.

The application note I am looking at is AN-762 "Linear Amplifiers for Mobile Operation". The amplifier they describe is a 180 watt assembly using two MRF421's in push-pull. The note does say that the minimum recommended collector idling current is 150mA, but that is for a MRF421, which has a hfe of 10 minimum, and 30 typical, a wide variation. The MRF449 data sheet I have only lists the minimum hfe of 10, and no typical value.

If you have the transistors mounted on a real good heat sink you can try setting the collector idling current higher. If the harmonic content of the output drops greatly then you will know, otherwise you are right and the answer has to be elsewhere. Sometimes its just faster to test an idea (if it can be done safely) than to screw around speculating about it.

Some other interesting tests to try would be to vary the drive level from zero to maximum, and also sweep the frequency over the bandwidth of the amplifier. Some amplifiers may work fine at some combinations of drive level, and frequency, while at others they get unstable.

I also have two other ideas.

First are you sure about the components you are using? For example if you have resistors in the RF path they should be non-inductive type such as metal film, or carbon. The metal film type you have to be very careful about because some manufactures use a spiral wrap of metal film on the ceramic base to get the required resistance value, which results in an inductive resistor.

Second did you try the amplifier using only one wire wound on the output transformer? I know it sounds dumb, but using two wires in parallel may look fine to you, however at RF the two wires may not look the same. A small change in wire length, or routing, can cause the coupling to be different on each wire. If one wire has a slightly higher voltage on it than the other one you get what looks like a low impedance short when the two wires are connected together at the ends.

Discouraging a new ham from pursuing a worthwhile homebrew endeavor is
about the worst thing we can do, it seems to me. Besides, building a
real radio (one made of glass, aluminum, big parts you can actually see
and touch) is about as worthwhile as you can get ... ESPECIALLY if it
transmits AM ... :-)

I just finished "The Best of Analogue Dialogue" - covers issues from 1988 to 196 - it's on Analogue Devices website as a *.pdf file. . Interesting commentary towards the end on using handie-talkie's to find out what's wrong with instrumentation amps.

I have one that works. Beware, it is a battery bandit, requires a new 9
volt about every hour or less. The VFO while stable, is quite the
microphone, resulting in feedback if you open up the receivers audio much.

It is a learning experience.

If you really want to run a Hartley, try the glowbugs archives at:

ftp://piobaire/mines.uidaho.edu/pub/Glowbugs/articles

for several reprints of vacuum tube gear that is simple, yet usable.
Also http://www.qsl.net/~n6ev/Glowbug.html is good. A search on the
net for glowbugs will turn up some interesting things.`

Good Luck....

Ain't that a pisser! What a lousy use of good RF triodes. They should
be using modern Svetlana types and not things useful in ancient radio
gear.... grumble, grumble, grumble...

The VT-4C, or 211 was the standard 50 watter tube in 20's-WWII ham and
military gear.

Bob/NA4G....
...having a hard time feeding his BC375 since the audiophools arrived.
That is a little biased, but nontheless quite true.... the audiophools
have killed off the existing supply, and burn the things up to boot!
Why don't they just use 833's or 4-1000A's or current production tubes
instead, if they are all that power mad!

AM is very much a minority interest (or a long-obsolete waste
of time, depending on your viewpoint) - you might try listening
first to see just how much activity there is before you spend
much time or money building a transmitter few will communicate
with.

Sorry if I stepped on any toes - that was not my intention.

I merely wanted to point out to a relatively new ham that AM no longer has the activity that it did in the era of the article that the fellow is using to guide his efforts.

There was a time when the progression from CW to "phone" was to add a modulator to the existing CW rig. That is what I did in 1948 or so when I started amplitude modulating the 813 instead of keying it.

Now, just to be very clear: AM is a wonderful mode of communication and is supported by a wonderful group of people on several bands. There is absolutely nothing wrong with whomever he might talk to on AM.

But, the SSB operators far outweigh them in sheer numbers. So, a new ham wishing to "get on phone" needs to look around a little before committing to the effort and expense of converting a cw transmitter tp AM operation.

That is my only point. My present rig - a Kachina 505DSP - is capable of near-broadcast quality AM with an audio bandpass of from 100 Hz to about 4200 Hz.
I suspect that I was operating AM long before most of the readers on this NG.
But, I would think twice today before setting out to duplicate a rig from a magazine article of the 50's or 60's and expecting to use it as a first venture into phone operation.

That was the intended gist of my posting and my only reason for making it.

I trust that Grant will communicate directly with the newcomer and offer his experience and resources in guidance and support.

I'm glad you asked since I'm kind of in a quandry about that. I've got the 1967 ARRL Radio Amateur's Handbook and on page 184 there is a design for a 3 band VFO. I like it but the tubes are going to run me about $30 (oh well). I like the design ok but it is the only one that I've found so far. When I built my transmitter I compiled over a dozen different designs and then chose the one that I thought would work best for me. Have you got any references to any other VFOs?

Rick

> Do you have the specific QST reference for the transmitter you built?

Nope, the design I used was published in the 1967 ARRL Amateur Handbook. Although I'm sure that it was also published in QST at some time prior to the Handbook release. However it is the "Inexpensive 75watt Transmitter" on page 180 of the handbook. The designer is not given but I'm assuming that it was a McCoy design. It looks like his usual good work and probably a "Beginner and Novice" article.

Yep, that seems to be the consences, the CB just won't work and your guess about the Stancor A3893 is right on the money. That's what the original article suggest using.

For anyone that is interested the design was published as a two parter, "A" Novice Gallon" or General 150", June 1962. And "Plate Modulation for the 150-Watter", July 1962.

I was not familiar with Elecraft until I read your post. They have a couple of low power HF rigs that
look quite interesting. A CW 80 to 10 meter transciever, and a two band 5W CW transceiver.
Here is there web site that I just browsed:

Further comment from the original poster of this question; me.
If it was the 'original' glue it was probably boiled up horses from the Civil War, or fish bones, or something!
(BTW Depending which country you are in you can select your own Civil War. e.g. Oliver Cromwell 1642!)
Seriously though we didn't finally decide what the proper 'loose base' product was; did we?
Many thanks for the various posts though.
Terry S.
I don't normally post 'above'. So, see below.

Rick,

People are at this very moment hunting you down for those tubes...

No, really, you've got some 211 triodes, originally designed in the mid '20s. The Golden Ear crowd loves big triodes including the 211. Do yours have good filaments and good getters? If you wanted to be adventurous you could do what some of the glowbugs crowd has done and make yourself a real OT Hartley or other form of self-excited oscillator transmitter. If you aren't on the glowbugs list yet you need to be there, being as interested as you are in tube homebrew. Easiest way to get the signup info is to look up the guide to radio newsgroups FAQ via Deja.

The VT4Cs are pretty low frequency tubes, and like any triode will take a relatively lot of driving power and require neutralization. (Anybody ever do 211s grounded grid?!) I'm not sure I'd try to make a PA with them (unless, again, you were going after a real period rig, in which case go for it!). The 813s are a much better candidate for High Powered Fun. You might consider trading the VT4Cs (to a ham with some vintage gear that uses them, not a Golden Ear <g>) for some good junkbox fill, or even good old U.S. dollars.

In the meantime, do what I'd do: go through the box of tubes and light each one up (got a big 12V transformer and a variac?) and look at it in the dark! I still remember doing that with my first 807, when I was about 12! The 211s will astonish you how bright they burn, if you're only used to indirectly heated tubes! BTW, here's a good online tube database:

http://www.nj7p.org/cgi-bin/tube

BTW, what VFO circuit are you building?

73,
Mike, KK6GM

Do you have the specific QST reference for the transmitter you built?

Assuming it's one of the 6146 designs running about 60-65 watts input AM and you want to plate modulate it, you need a transformer along the lines of a UTC CVM-1 or CVM-2 or Stancor A3892/3. You will need a transformer capable of handling at least 30 watts of audio -- considerably higher than something out of a CB radio will provide.

I suggest you post your needs in a couple of places. You will likely get more help than you can handle and probably find the transformer you need, too.

Go to http://www.thebizlink.com/am/ and follow the link to the "B-Board". Lots of other good info at the site also (worth spending some time there), including an article on using TV-type power transformers in modulation service.

You can also go to the AM North America site (http://www.bigcountry.com/w5ami/), and subscribe to the AM Email Reflector. There is also a wealth of AM info available in the AM Press Exchange, archived at this site.

There are a considerable number of people who prefer and are still on AM.

Great tube! Army Air Corps used them in great numbers in the BC-375 airborne liaison transmitter. B-17s and B-29s used the BC-375 100 watt plus transmitter for long range communications, before the Collins ART-13 came along which used the 813 for slightly more power output.

The BC-375 used two of the tubes in what was called an MOPA (master oscillator/power amplifier) circuit. Self excited! Another VT-4C was the modulator tube. In CW mode, the dynamotor slowed with keying and the oscillator did a little frequency "YOOOOP" which was quite pleasant to copy and distinctive enough to identify in the biggest of "dogpiles". This easy identification of various stations was common in the "good(?)old days" and made for a more "friendly" operating environment. Trust me.

DOWN WITH AUTOMATIC KEYERS AND THEIR PRISSY PERFECT KEYING!

In 1948 I built a final amplifier (class C, of course), using two VT4-Cs in push-pull. B&W made good plug-in tank coils with "swinging link" output coupling for 72 or 300 ohm twin lead (use what ever you had, didn't seem to make much difference) to the antenna tuner. Driving this breadboarded amplifier with a single 1625 (or an ARC-5 if you had one) an honest, finger burning 175 watts OUTPUT was available where the 600 ohm open- wire feedline went through the attic wall. ZLs and VKs were a piece of cake of 40 meters, and if you really liked to copy through noise, they were there on 80 too. But I digress.

You might have to worry about the PA collector to emitter breakdown voltage being exceeded. Why not wire in a double balanced mixer and generate double side band suppressed carrier?

But, before you go to very much trouble, you should seriously ponder who it is that you are likely to be talking to.

There are a few AM stations on 75, 20 and 10 meters that I know of, and possibly others. But, they are few and far between and most are running considerable power. Some to the extent of ex-broadcast transmitters modified to work on the ham bands.

I am afraid that the days when a few watts of AM on ten meters would work the world are about gone.

Not trying to rain on your parade or discourage experimentation and building, but you really should consider the end result of your labors.

That's discouraging if it's true! It just occurred to me this past week that my "useless" 7.250 crystal could get me on 10m AM (29.000). I've got both some shorty 807s (5933WA) and loctal 807s (really! actually they're CV428s) that I expect would do well on 10, and a UTC 30W mod. transformer, and I was just beginning to think seriously about building both my first 10m rig and my first AM rig. Tell me that somebody would talk to me! :)

Hi Rick..don't pay any attention to the doubting Thomas's about AM :-)
There's plenty of AM activity on the bands
check out http://www.thebizlink.com/am

As far as the modulation transformers in the CBs go, it depends on what kind of tube you want to modulate. I am assuming that the old CBs you are talking about are tube-type sets. If they are solid state, then the impedence of the transformers will be too low and will not work. Tube type CB transformers can modulate a transmitter running up to..oh, say about 8 to 10 watts input or so. What kind of power level is the transmitter you are talking about, and what kind of old CBs do you have?

You know, the hollow-state glowbugs with a rockbound 6L6G, 807, 6146 ...

I've been fooling around with a modern-millenium version using several stages of emitter- and source-followers, with crystal in the feedback path, and have succeeded in getting 40-50W of clean 160-30M rf without excessive crystal current.

Lineup is MPF102-2N3866-MRF454, dead-bug, on brass plates, in memory of the tinned cake pans I can not find any more.

A CB-type amp can be made to oscillate merrily almost anywhere in hf, by link-coupling output to input.

Any kindred spirits out there want to swap ideas?

Email is good.

I have a few used Collins Mechanical Filters that I would like to possibly use in future projects.

Can someone point me to where I can find as much information as possible on these filters. I would like to know things like pinouts, how to install them in the circuit, and are there any special considerations I need to be aware of?

I would also like to know if they can be tested outside of the circuit?

Analog's web site only sells to North American customers, and
Australia, the original poster's location, is not part of
North America.

I was amazed to see that they actually have stock on this one.
They're quoting next spring for the last part I tried to order
from them. :-(

>I would like to know things like pinouts, how to install
>them in the circuit, and are there any special considerations I need to be
>aware of?

Each end of a filter will have a coil, and the coils are typically not
grounded. All one has to do is find continuity on two coils.

Typically, the coils should be resonated with an external capacitor of
about 130 pF, either series or parallel. DC current should not be
allowed to flow in the coils if one wants the specified frequency and
bandwidth.

>I would also like to know if they can be tested outside of the circuit?

The coil on each end should have some small non-zero resistance which
is easily tested, and typically should have high resistance to ground.

Certainly old mags do contain interesting things, but before building them, yes, beware. as a kid I built a "Short-wave" rx from an old mag (wish I'd kept it!!!). The thing would only rec the broadcast band. After several rebuilds to get it "right", I finally realized that in the 20's & 30's BC band WAS short wave . Felt silly at the time but got over it

rec.radio.amateur.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi all,

I have reproduced the diode boards for the Classic Collins 30L-1. If you have a 30L-1 and it has the original 1N1492 top hat diodes in it, you probably need one of these boards. Out of the seven amps I checked out, five of them had at least two shorted diodes. These new boards are just like the original in that all components are placed just where they are on the original. This board is extremely high quality and will live up to the Collins standards. All components are either NOS or NEW. The 16 rectifier diodes have been upgraded to new 1N5408's (3 Amp, 1000 volt PIV) made either by Motorola (now ON Semiconductor), or by Vishay. The 16 ceramic capacitors are 1KV ceramic disks made in the USA by Sprague. The 1500 Ohm resistor is a genuine Carbon Composition 2W 5% Allen Bradley! The 4 Meg 2W, 1% metal film resistor is a genuine Dale, and the 1 Ohm 5W 1% is either a Dale or Pacific NOS mil spec resistor or when these run out, it will be a New Ohmite brand. All assembly is being done by a NASA certified solderer. I have used the best components I could buy and hired the best assembler I could find. I wanted this board to be truely Collins Quality. A photo (not a very good one however) can be seen at http://members.aol.com/dw130/diode1.jpg If you would like to place an order for one or more of these boards they are $79.00 each + $4.50 total shipping in US (no matter how many boards you order). If overseas, shipping will be actual cost. Please send to:

If I may comment?
I have no expertise or practical experience on this; but I gather there are 'other' methods of AM modulating.
1) Heising, choke, modulation, of the PA.
2) Modulating the screen grid or and/or suppressor grid; if the finals are tetrodes or pentodes.
3) Cathode modulation. I heard ana amateur on one occasion describe. on air, how he was modulating through the cathode keying jack of his PA/Final! Seemed to work I could hear him!
4) Modulating at an earlier stage of the transmitter; might have consequence that you have to run the PA in Class A?
5) What was that original method? A carbon granule microphone directly in series with the aerial lead; circa 1910 etc.! One 'Hot' mike I'd say!
Probably none of these methods were/are 'as good' as plate modulation or result in 100% modulation? .
Oh btw I seem to remember one chap who for Heising (i.e. choke modulation) was using one winding of some kind of transformer as a choke?
In other words; 'where there is a will.....".
Trust my comments are not out of line (hey there's a new abbreviation; "OOL" Or has it already been invented?)
Terry S.

1964. FS: 220 MHz power modules type M68729 30 W out for 300mW in

I have 1 of the type M68729 class C (i.e. FM) 30 Watts out average, 40 Watts max. These will replace older M57774 modual just fine. The input drive is 300 mW for 30 watts out. I am asking $50.00 including shipping to conus for them. RF parts wants around $70.00 for the same.

These are brand new never been used and still have the one inch leads on them.

Thank You,

Bryan Fields, KB9MCI

Good luck!

There is very little of anything that Analog Devices can
ship before the new year - I recently tried to obtain a
couple of AD8307s. All their production seems to already
be spoken for.

All the manufacturers are quoting horrendous lead times.
It makes me wonder how they expect anybody to innovate,
when even samples require 6 months or more to obtain.

The strange thing is that the audiophools aren't even using these things in high power amps! The latest fad among the audio crowd is "SET" or single-ended triode, operated in class A! A 211 operated this way has a very short life and a power output of 20-25 watts or so (less than a pair of 6L6s in P-P). The 211 is much better suited to class B modulator service, or class C RF amplifier duty.

Maybe if enough of the "golden ears" start playing around with transmitter tube amps, they will reduce their population through contact with the plate supply! :)

Rebuilding the control circuitry on my repeater. I would like to add
digital audio delay to remove squelch tails and mute DTMF. I've gotten
lazy, smarter or less arrogant (maybe all 3, but I'm still cheap and enjoy
building) through the years and don't want to design it from scratch.

Does anyone have a cool circuit to do what I'm looking for? I see NHRC has
one for about $80, but as I said I'm still cheap and enjoy building.

Thanks for your help!

I'm not familiar with the particular device you are asking about, but I have built and programmed several test fixtures for serial loading pll chips. The code I have written is in Visual Basic and uses the parallel port for "bit banging" the serial data out. The usual sequence is: pull the select line and delay for setup, set the data bit on one port line and delay until stable, clock the bit using another port line (all of the devices I have worked with clock on the rising edge), and then release the select line X nS after the last bit has been clocked. It's very important to make sure the data bit is stable before the rising edge of the clock occurs. This requires playing with delays in your program. You also must know the format of the serial data- MSB or LSB first, registers, etc. I assume you have a data sheet for the part? Sorry to ramble- this is what I've been doing at work for the past 6 months. I could e-mail you some sample VB code, if you like.

paralleling additional batteries would provide longer backup time in the
event of "the main" going down, however to increase to power capability of
the inverter would not be a trivial task. That's the simple answer. If you
would like a complicated explanation of what would be required to increase
the power of the inverter, that is: transformer redesign, Switching device
selection, etc I'd be happy to go into that.

While it is true that most ADI product is on heavy allocation I can assure you that if they believe that by providing a few samples will get them a major "design win" (hundreds of thousands per year) they will find some samples. With the current market conditions they will not provide any quantity to experimenters when they can't keep their "real" customers production lines running (this includes their distributor partners (Future Electronics, Avnet and Pioneer).

If you work for a major OEM and you are an established ADI customer many times you can get the sales guy to find you a sample or two.

That being said, there are always what is called "Grey Market" inventory to be found. Check the web or Electronics Buyers News for electronic component brokers, these are companies that make there money by buying excess (or in some cases stolen) inventory from OEMs and inflating the price beyond belief and taking advantage of customers who "Have to have it"

Increasing the battery capacity on a UPS will increase the available backup time, but will not increase the output power rating. The only way to increase the available output power is to upgrade the inverter section power components (transistors, SCRs, transformer, heatsinks). This will involve extensive modification and design work, and is probably not economically feasible. Buy a bigger UPS if you need more power.

Adding more batteries to an existing unit will allow the UPS to produce power for a longer time under blackout conditions. The limiting factor here (besides physical size) is the current available from the UPS charging circuit. As long as you aren't overloading the charger, adding more battery capacity should be fine. Upgrading the charging circuit to work with a bigger battery bank is possible, but specifics will depend on your particular unit.

Take a peek at Jim Kortge's site http://www.qsl.net/k8iqy. His 2N2/40 is one dynamite rig. OK, it's 40, but it shouldn't be too tough to move to 30. (I'm working on a 20 meter port but it's a bit of a challenge.) Jim also has a 15 meter version in the works. It's more focused on parts that are readily available in the third world, which sometimes may means they are harder to find in the U.S.

Getting something stable at 20 is somewhat more of a challenge than at 40. An ordinary, analog VFO at a reasonable high frequency is tough to make stable enough for CW, and synthesis is complex (i.e. expensive). Having the VFO too low means making the IF higher than you would like.

I've been playing with a completely scratch rockbound unit for 15. Looks like it will work well enough for my purposes, which is really not very well. But it is amazingly simple just to brew something up. This particular rig is really minimal, but serves my purpose. I expect it will undergo some cycles of modification and maybe become reasonable after a while. But for now it's good enough, and for me, the tinkering is most of the fun.

If you study the schematics for the popular QRP radios, you will see they share a tremendous amount in common. Usually it's fairly obvious why the designer chose one trade off for another. You can see where Dave Fifield sacrificed supply current for dynamic range in the NC-20, while Dave Benson chose low power consumption at the expense of the receiver. But otherwise, it's amazing how much the NC-20, SW-xx, SMK-1, etc. look alike. It isn't all that tough to borrow a bit from here and a piece from there and come up with something for your favorite set of tradeoffs!

Hello--

A larger storage battery will provide longer operating time, but not
more AC power.

If you do decide to run the UPS for extended intervals, consider adding
a 12-volt DC-powered fan to push additional cooling air through the
unit. Some I've seen looked marginal in the designer''s choice of device
heatsinks- no doubt because these UPSes were designed to supply
power for only short intervals.

I have 1 of the type M68729 class C (i.e. FM) 30 Watts out average, 40 Watts max. These will replace older M57774 modual just fine. The input drive is 300 mW for 30 watts out. I am asking $50.00 including shipping to conus for them. RF parts wants around $70.00 for the same.

These are brand new never been used and still have the one inch leads on them.

Thank You,

96Intruder800@home.com says...

> Does anyone know how I can increase the distance on a Motorola two way
> handheld radio and a CB handheld (not yet bought)? Recommendation of name

Yes. Get as physically high up and clear of obstacles as you can,
or use them over terrain that is as flat and obstacle-free as possible.

Any other method (such as increasing output power or altering the
frequencies) will likely violate federal law, and will produce the risk
of the FCC breathing down your neck, the Justice Dept. close behind.

If you really want to do distance communication with portable
radios, I suggest you, and those you want to communicate with, get your
ham radio licenses.

I would also suggest that you not spam the same message to multiple
newsgroups. You will usually succeed only in making people mad at you,
which will in turn make them that much less likely to want to answer your
queries (intelligently). In fact, I would not be in the least surprised
if you've already received some less-than-helpful suggestions.

1993. How to, Tube signal generator

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-28 00:00:00 UTC
From: Rick Haub <rhaub@midwestmicro-tek.com>
Message-ID: <39AA8590.DF3FBE15@midwestmicro-tek.com>
Source record: 58273

This weekend I built a signal generator that will generate signals from 1Hz to 10MHz on a TTL level. I want to use this generator to help me trouble shoot my tube gear. Assuming I'm building a Superhet type receiver what kind of voltage levels do I need for the various stages? Should I add a tube amp stage to my generator to get a 100 or more volt output section? As it is, it is working great for determining the tuning range of some I.F. filters that I had to build for a receiver I'm building. Finding 100kHz and 1600kHz filters has not been easy so I've started building my own.

> (I assume NiCads) used in these units.?

Not necessarily. Ours uses lead acid and/or 'gel cells'. With gel cells it is not recommended paralleling them with 'real' lead acid batteries! Cos float and other voltages can be different.

We have two separate UPS. The physically larger and older one is now connected to two external 12 volt ex truck batteries they'll need replacing soon! The smaller one retains it's now ageing internal small gel cell battery but we'll have to replace that soon also.. We have made no attempt to parallel either the inputs or the out puts of these UPS. Too dangerous!

BTW our 'smaller' and newer UPS has a higher rated wattage output than our 'larger' older one. But it has battery capacity for only about 20 minutes or so.

.
I agree with the previous comment. The only way to get more capacity is to get a larger UPS. Or split the AC load over more than one UPS unit. For example we have several computers and a modem on the UPSs but we can arrange so that only one monitor screen unit is on the UPS.

Alternative! Get a gasoline/diesel generator.

Putting bigger batteries in a UPS would no different to putting a bigger gas tank in a car! Wouldn't do anything to increase the horsepower of the engine. Just means you could run longer. And would be more weight to drag around btw.

If bigger batteries are used, the UPS it must have sufficient capacity to recharge the bigger batteries, automatically. So at very least with the bigger battery, an adjustment of the charging circuit MAY be required? Also if there is insufficient charging capacity to bring the batteries 'back up' to a fully charged state after each use of the UPS, the batteries may stay in a state of undercharge and be ruined quite quickly!

Just a couple of comments.

Most signal generators have outputs adjustable from about 0.2 microvolt to 100 millivolts or so. You won't need any more than that for receiver alignment. If you are working on transmitters, especially power stages, you may need more. If you want to work on big amplifiers, you will need a lot more. Driving an amplifier to full output requres 50 or 100 Volts, roughly speaking. But if you are doing that you probably would just use a transmitter as the source.

Rick,

The quick answer is "no", you should not have to add a tube stage to the output of your generator. Even if you did, you probably wouldn't get a 100 volt signal out, nor would you need one.

I think you are confusing "AC signal" levels with "DC bias voltage" levels.

In a tube circuit, you may be working with high DC voltages on the grids and plates, however, that's for setting the proper bias levels, so that the tube will amplify properly. This is similar to the bias voltages on the emitter, base, and collector of a transistor circuit. Most commonly you would want your tube or transistor to operate where it's characteristics are mostly linear. There are exceptions to this, but in a receiver this is generally true.

The "signal" level refers to the AC signal that is really your RF/IF/AF signal. When you start at the receiver antenna terminals the signal lever is in the "micro volt" range. As the signal travels through the different stages (i.e. RF amp, mixer, IF amp, detector, AF amp) the signal is amplified. By the time signal gets through the RF amp, mixer, IF amp, and detector the signal has been amplified 1000 or 2000 times, but that still only puts the signal in the "milli volt" range.

What all this means is that, if you were to stack up a simple single conversion transistor receiver and simple single conversion tube receiver, you would see that they both have the same stages.

They are both receiving the same signal, at the antenna terminals,
and they are both trying to drive a speaker. Which all says that,
stage for stage, the signal levels are the same.

Now, yes, I have greatly simplified everything and left out a
lot of technical details, but I hope that it gets the point across.
The signal levels from your home made signal generator should
be just fine, as is. Just make sure that when you are trying to
inject a signal into any circuit, you use an appropriate
isolation capacitor or you could do damage to the generator
or the stage under test. Or worse, you could do damage to yourself.

I had never heard that one before, but it may not be so far fetched.
I worked on the first experimental Loran C installation, circa 1950.
The receiver at the master station used a 3E29 as the first rf stage
and a 6AG7 as the second. Of course it was done for a different
reason. During the 1-megawatt pulse from the xmtr, the station
receiver rf stages were biased off, so that the main pulse reached the
video circuits only through the interelectrode capacitances of the

tubes. I do not remember the receiver input impedance, but if it were 50 ohms, the rf voltage at the receiver antenna terminals would have been in the order of 7100 V. So it took a pulse-rated tube, like the 3E29 (not an 829B) to withstand the high peak voltages. Ditto for the second stage, requiring a large tube like the 6AG7.

There's a similar indicator on the vertical-amp board in the 492, if I remember correctly. It appears to work on some sort of ion-migration principle. When the unit is powered up, the applied voltage causes a visible track to form over time in the chemical within the tube. Mine showed only a few hours of use, as someone had evidently replaced the board not long before I bought the 492.

A similar device was used in the HP8551B to track the # of hours on the exotic (and in its day, expensive) backward-wave oscillator tube. The timer element and BWO tube were supposed to be replaced together.

There was a construction article for an RF millivoltmeter some time ago that sounds similar. It used a chopper to create a "dummy" signal that matched the signal being measured.

This tracked out many of the non-linearities in the detector diode and allowed the circuit to work from less than 70 mV up to 3 volts.

From the chart, it looked as if it'd measure down to less than 10 mV and for a relative measurement it ought to be fine.

If you can find it, look in HAM RADIO November 1987 Page 65.

Unfortunately, I do not have a scanner, but the circuit is fairly straightforward with easy to get components.

I'd guess using surface mount parts in the detector rf section, you ought to be able to push the upper frequency limit up towards the microwave region.

> Don't poke too much fun their way.

I poke rusty rettysnitches their way, for the following one and only reason.

1. The tubes are not in production, anymore, and should not be wasted on
audio amps that burn them up, ad nauseum.

They should be using current production tubes for such short-lived use.

End tirade.....

> Also, remember when a 20-watt amp was *high power* and that most "PA"

> amplifier that could fill a living room and then some. But, I had it
> tied to a horn-loaded speaker - suppose that made any difference?

Yeah, I had a fine little stereo with dual 2 watt amps and that was
enough, with good speakers to run the Boston Pops or Kreisler at
volume sufficient to run you out of the room.

> Seems that watts have gotten a lot smaller since then . . .

The audiophools use them for status symbols. It is good for the hearing
aid sales though.... but bad for tube radio gear....

Hi, Everybody,

Sanity check: If two identical crystal filters are cascaded in a circuit, the total bandwidth equals the bandwidth of either filter, right? The purpose of doing this is to improve the shape factor, right?

Cascading two identical L-C filters yields the same results as with crystal filters, right?

>>>

This should probably be < rec.radio.amateur.homebrew > but if I may OT on
'Product Detector'?

What would be a good place to get info on a product detector that I Icould
add to a circa 1940s British miltary tube receiver? The IF is 465 kcs.

I don't want to chop any holes in the old monster. But overall it appears
stable enough to receive SSB, and the BFO itself has a reduction drive
tuning control. So, I'd like to try an add on product detector that would
not become a permanent part of the receiver?.

What I'm thinking about is something I could build on a small plate (lots of
room in there!) with a lead to plug into the audio amp, detector tube socket
which is a Mullard EBC33, pretty well the equivalent of a 6SR7/6SQ7. Have to
check the AVC diode also, it's in the same tube! If transistorized I think I
can get DC from the 12-14 volt AC heater line to the tube socket via a
rectifier and smoothing, or from a divider network across the B+/HT of the
receiver which is easily accessible. The 6.3 volt tube heaters are in
series/parallel btw.

Anybody steer me in the right direction, for a circuit?

Thanks. Terry S..

2013. Field Stregth meter circuit...How? DE K0FF

Newsgroup: rec.radio.amateur.homebrew

From: K0FF@ARRL.NET
Message-ID: <007201c011c5$7b8c5dc0$41c249d8@K0FF>
Source record: 58290

The circuit for the field Strength meter is drawn "UK" style and has a little different look than the way we would draw it in the US, but all the details are the same. The coils is self resonant, that is there is no external capacitor needed to form the tuned circuit. On lower frequencies, as coil-capacitor tank would be used. The diode is just a rectifier and the resistor supplies a load, while the capacitor acts like a smoothing cap in any power supply (here the ripple freq is quite high of course). Any value will work and I usually use a .001

Try adding another diode, tie it's cathode (bar) end to the anode of the existing diode, and ground the other end. I find that the sensitivity increases.

Don't forget that you can always buy a generator, Generac or whatever. To bracket this, a 5kW unit maybe $500 to $700 for gasoline fed, a 20kW natural gas, lpg, 85dB Mitsubishi backup is about $8000 (incuding transfer switch and a few hundred bucks to pour a slab.) Sound like a lot to pay? Not if you are an ISP and suffer from the poor service - ATT is supposedly rebating 1 months fees if their feed is down for more than 8 hours in one stretch.

I did get a schematic from Boonton, years ago. I still have the diagram,
and if anybody is interested, I can send it out to you. The most expensive
parts of the probe are the Hewlett Packard zero bias schottky diodes. I
have built probes, using 1N5711 schottky diodes, and using a 50 Ohm source,
saw now difference between the homebrew probes and the stock Boonton probe.

The early ones might have used a tube as the detector, but the probes for the 92X series of meters did use solid state diodes. The mechanical chopper was kept in use, until the 92C came out, whereby the mechanical chopper was replaced with a 4016 analog switch. There was an upgrade kit available from Boonton, for the older solid state units. I think that it cost somewhere around 150 dollars. When I worked at Rockwell-Collins, the fellows in the cal lab used to do that upgrade.

Message-ID: <39AB4E7B.F4148DB2@home.com>
Source record: 58283

This was apparently an item on some 7XXX series scopes and I would like to know how it works. I noticed in the low voltage schematic for the R7704 a "useage meter" which bridged the +5volts to ground. My R7704 doesn't have the part installed, and it appears to have been optional since the color in the schematic is light blue.

Does anyone know how this indicator would have worked. It would apparently be "full" at 5000 hours of useage.

Interesting too, one of the fuses, on the 150 VDC line had, what I believe to be a 5 ohm resistor inside of it. It was a Littlefuse 313 3AG 1/4 amp with a resistor (blown) inside the thing. Never seen anything like it.

Of course, there were also spider nests in the carcase.

The seller didn't charge for the spiders.

Darrell,
It is V101 and it is a 6BM8 tube which is the AF Amp.
The actual V1 tube is a 6U8 which is the second tube on the left side
of the VFO looking from the back.
Hope that helps,
John

Hi Steve.

I used one of these at work, some 36 years ago. I don't think that I'm wrong in saying that the probe was a diode rectifier (miniature thermionic tube), followed by a chopper circuit (chops up the resultant low-level DC voltage into AC). I think that the chopping frequency was 1kHz, from a mechanical vibrator (you could hear this buzzing away quietly). The resultant AC waveform was fed to a high-gain AC amplifer (does not suffer from DC drift), and fed to a synchronous detector (driven by the same 1kHz chopping signal). This gave out a relatively high-level DC voltage, which drove the meter.

I 'aquired' the unit but, by then, the probe was faulty (you can only drop them so often!). I think that I binned it ('threw it in the trash can', in American - much against my religion!). Undoubtedly, I still have the large meter somewhere, and I think that I still have the manual (green plastic cover).

Rather than trying to fix the probe, it might be better to use modern technology, and construct completely new unit. You could use the old case and meter (a bit like the 'reproduction' 1930s/1940s domestic radios, which just happen to have the FM band!).

73,
Ian.

When cascading filters in order to improve shape factor it is a good idea to put an amplifier stage between them because filters tied directly together very often interact with each other in ways that messes up the frequency response. The reason is that each filter wants to see a resistance at each end, both in the passband and just outside the passband. The amplifier stage "isolates" the two filters from each other.

A simulation program like ARRL Radio Designer will show what happens.

Hello,

I put this 8051 development system up on ebay a few days ago.
Maybe some of you might be interested in it.

The 900MHz band is out their waiting for all of us. For years I have been looking for commercial 900MHz amateur gear with no luck. It seems that Kenwood, Icom, Yaesu just do not care about the 900MHz band.

Does anyone have information on how I can convert a 900MHz business radio to amateur? Which radios work the best for conversions? I have fair knowledge of electronics. Please post any information you may have.

Thank you,
Adam Huber-KD6SRI

"Solid state design manual" by W1FB/W7ZOI describes some broadband
amplifiers up to 30dBm, but if you only need 15-20dBm it can be
simplified, particularly easy if you do not require it to work perfect
above 10MHz. I made such simplified broadband amplifier to cover
100kHz-10MHz as pre-amp for 136kHz RX project

roll-off above 10MHz is often a problem, but won't be more than a few
dB around 40MHz for a simple design

> anwers?

Hello--
A switched-mode power supply typically rectifies whatever AC it's fed and thus
doesn't object to poorly-shaped AC. However, any device that relies on a
conventional
iron-core power transformer may have problems due to the harmonic content.

Your TV *should* work fine, but without fully understanding its internal design
that's a
guess and not a guarantee.

Hello--
IIRC, one type of indicator used a mercury-filled column and featured a plating reaction of some sort that would move the indicator gap along a glass capillary tube. The action was reversible by reverse-biasing the unit. Now, if I can remember the trade name....

IIRC, it was "Indachron" manufactured by Curtis Instruments. Also used on broadcast VTR headwheel assemblies, to schedule head replacement after so many thousands of hours. A small mercury-filled tube, with a gap that traveled along its length by means of some electrochemical process. Time range was set by means of a series current limiting resistor. Some of these things had a third electrode that could be used to trigger an alarm after a specified time had accumulated.

2033. Re: Boonton RF Millivoltmeter PROBE: Can you build one?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-30 00:00:00 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <39ADD677.59944C82@eznec.com>
Source record: 58221

I haven't followed this thread, so please pardon me if I'm repeating what someone else has said.

I've spent a career designing electronic test equipment. In precision equipment, the devil is in the details. Physical circuit layout is often at least as important as the components. And the components are often selected or specially specified. I've been involved with the design of a number of products that you could have the schematic of, and in some cases a detailed layout, and still not be able to produce an instrument with anything like the performance of the real thing. ("Performance" usually includes repeatability, flatness with frequency, circuit loading, and basic predictability. Sensitivity is often one of the easiest things to achieve.)

This isn't meant to discourage you from building your own probe, or learning from the way Boonton does it. And you're likely to find a homebrew one to be very useful for lots of applications. But don't think that you'll necessarily have a probe with overall performance anything like the Boonton.

2034. Log Periodic Antenna Question

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-30 00:24:55 UTC
From: "T.G." <shbcommm@indigo.ie>
Message-ID: <svYq5.19646$r4.9982@news.indigo.ie>
Source record: 58202

Hi,
I have constructed a log periodic antenna for the frequency range 100 to 1300 MHz.
It is nearly ready to install onto my antenna mast outside but I still have to attach the coaxial line. I copied the antenna dimensions from a friends commercial design and noted that on this antenna the coax line terminates in a small solid rectangular plastic block (approx 10mm high, 15 mm wide and 40mm long) with bolts protruding for attachment to each of the two main booms ie one for the 'active side and one for the 'groundplane' side. What I need to know is this - Inside that plastic block would there be some sort of impedance matching device connected accross the two bolt heads, ie a balun, coil or whatever? Do log periodics have this tye of matching normally? The coaxial cable going into this block is RG58 which of course is 50 ohms, so I also intend useing this type.

Thanks for your time.
Terry

I would use something better than RG 58U!!! Why not use 9913 with a
short RG214 jumper for flexibility?

2039. Re: Field Strength Meter

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-30 01:45:57 UTC
From: Dick Carroll <dixie@townsqr.com>
Message-ID: <8ohp0linj0@208.207.71.163>
Source record: 58206

It is an untuned raw RF detector with indicator (meter). It is not
frequency selective and will pick up all local RF, adding all sources to
the meter reading as a single indication (that probably won't be a
problem as you are using it, if you don't live near a BC station or
other strong RF source).
The capacitor is a filter capacitor which acts to smooth the detected
ripple frequency to DC just as in any AC power supply.
It can be made more sensitive by adding another diode as a voltage
doubler, as noted by K0FF.

Yep, I've seen that page. It looks like an interesting rig, but I don't have the requisite skills to perform a band conversion. My ability stops about where I'd replace the audio section with an LM386. I wouldn't know where to start to recalculate the IF section's various bits for the new frequency for instance.
Wouldn't mind learning though.
Thanks & 73

Source record: 58209

In addition to the other replies, you will likely need to arrange some means of controlling the level of your signal generator if you haven't done so. For your usage you should align with the minimum signal level that the receiver will receive, so that you can note increases or decreases in the received level as you "tune" the receiver's tuned circuits. A variable attenuator can be something as simple as a potentiometer, of 10 K or so, using the variable arm for the output.

I recently bought a 500 watt UPS that runs on an internal 12volt 7amp gel cell, with the intent of using it part time as low power AC in an RV to power a small AC powered TV using the RV's house battery to supply the UPS in place of the internal battery. Upon opening the UPS package I found a warning that "The output is not sinusoidal, but has 47% harmonic content, use only for computer power supplies". Remembering what happened to a sattelite TV dish positioner years ago when I powered it from a small Honda AC generator gave me pause- it took out the MOV's in the AC primary wiring, evidently due to excessive transients. Now I wonder if I dare power the 14 inch switchmode powered TV with the UPS, with all its "harmonic content" in the output. Is this "harmonic content" harmful only to transformer-type power supplies and no problem on switch mode units, or is this warning only a standard disclaimer? Anyone have anwers?

2047. filter for a switching power supply

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-31 00:00:00 UTC
From: "sb1963_bis@yahoo.com" <sb1963_bis@yahoo.com>
Message-ID: <39AE311A.541AD7C4@yahoo.com>
Source record: 58226

I just got as a present from a friend a compact switching power supply from his defunct computer. This tiny power supply delivers 12.4V DC at 1.2 A and can be plugged into any AC outlet from 90 to 240 VAC. Looks like a nice option to power a small SW receiver, but...

I tried this power supply with my home-build TenTec 1253 receiver. This power supply is definitely not filtered. The result is a strong AC hume through the radio speaker.

Does anybody in this newsgroup have any experience in filtering out the AC hume from a switching power supply so it can be used with a SW radio? Will a 1000 uF or so capacitor be enough? Or do I need to build a more elaborate filter ?

Any help or advise will be greatly appreciated.

Hey Rick,

The other guys are right- you don't need another stage. One very good reason on the list of reasons to homebrew is filling the need for stuff you just can't buy. Keep up the good work.

> applied voltage causes a visible track to form over time in
> the chemical within the tube. [...]

I can't speak for the particular applications mentioned above, but the descriptions do indeed suggest an "electrochemical running time meter."

I purchased three such devices as NOS from BNF Enterprises many years ago. Local entropy has apparently swallowed them up for now, but from memory I recall that they consist of a glass capillary tube containing mercury and a clear electrolyte. Wires attach to terminals at the ends of the tube. The tube itself is mounted in a small plastic holder against a graduated scale. A small current (typically in microamps) is passed through the device. As John suggested, ion migration causes a tiny "bubble" (the clear electrolyte) to appear to move from one end of the tube to the other as the mercury "de-plates" from one side of the bubble and "plates" on the other side. The process is reversible.

I think mine were made by Curtis, and the name "Indachron" comes to mind, although my recollections may be somewhat scrambled here.

Source record: 58227

If you are hearing a hum (50/60Hz AC line hum) through a switching converter, chances are it's not because it's not filtered. The switching frequency is what needs to be filtered, and that's typically at 20kHz or greater, which you can't hear. More likely, it's a ground-loop or power-line noise getting coupled into the signal wires somewhere. To make sure, take a look at the output AC-coupled on an oscope. See how much 60Hz is on it, but chances are you'll see more at 20kHz.

If all else fails, you could brew up a simple LC filter. Take a high-mu core (>1000uo) and wind a few dozen turns on it. Run that in series from the supply to your 1mF cap and that should help some.

Why would a badly filtered switched mode power supply produce AC hum ?
The interference should be a high pitched (probably inaudible)
whistling noise.

Computer power supplies require that there is some load (maybe 1 A) on
the 5 V line in order to have properly regulated voltages on the other
supply voltages.

If it is really AC hum you are hearing, most probably the power supply
is not in a grounded wall outlet, thus the power supply chassis will
be at 1/2 the AC mains voltage (110 Vac or 55 Vac depending on
country) due to the filter capacitors at the power supply input.
Connect the power supply to a properly grounded wall outlet and the
chassis (and the 0 Vdc line) will be at ground potential.

I have an FT901 that is driving me up the wall!

I cannot align the USB / LSB carrier crystals properly. Can anyone tell me the bandwidth of the XF8.9HS SSB filter used in the rig?

What are the correct carrier frequencies; I can work them out from the bandwidth however.

Has anyone else had a similar problem?

Thanks in anticipation

I got an obsolete HP 8505A network analyzer.

It looks defective (especially the polar mode), although I can realize power level measurements seting in the cartesian reference.

I do not know about the phase measurements accuracy.

Is there any particular calibration procedure or particlar method to determine it?

I do not have any VNA TRL calibration kit available.

I suspect that the XF8.9HS is a crystal filter. Over time these have a
tendency to change the passband characteristics alarmingly and no amount
of carrier crystal aligning will compensate. If you have a scope and
sig gen, plot the output over its passband and check the results are
acceptable.

<you might find some info about GSM900 on the site>

I hope that the headlines were competitive enough to raise your
appetite. :-)

Nokia and Mobira are brands that are on sale everywhere. These are
the recent cell phones, if you are looking for some 'warez' for
them, too bad. Try again...:-)

However, Nokia/Mobira radios have been sold longer than there were
any cellular networks, just like Motorola. And when the first NMT
cellular networks emerged in the Nordic countries in 1981, there
was a Mobira phone available. And, as you can confirm from many
public sources, this is the way it has been ever since.

Most phones, starting from that era until the early 90's, have two
attractive features when compared to the phones of today. They used
a common single-chip CPU like RCA1802/1806, Hitachi HD6303 or Moto
68HC11, and the program was stored on a common DIL EPROM.

The standards we are talking about are NMT450 and NMT900. There
is also some plain-vanilla and trunked 80/150/450 MHz equipment.
Most of them are Nokia/Mobira, there are also some other Finnish
brands like Benefon and Televa, and some Nokia PMR equipment is
actually OEM stuff from companies like Kyodo and Philips. We also

have links to some pages with conversion info for other European
brands.

Well, we took a couple of these beasts, gave them the only treat-
ment we know of, and you'll see the rest on our pages:

http://oh3tr.ele.tut.fi/english/modifications.html

The NMT phones have been used in all Nordic countries, Holland,
Switzerland, Poland, the Czech Republic, Thailand, Malaysia and
in many other countries. The trunked PMR phones have been exported
to many European countries like Germany, Holland, Spain and the UK.
You can even find them in the Azores or even in Sierra Leone.

The language of the pages has been chosen so that it is understood
all over the world. This means bad English. The pages appear also in
French, Italian and Spanish. If you think you can help in translating
them to e.g. German or to some of the Scandinavian languages, please
do not hesitate to contact us.

We are also looking for people who would like to write software and
make modification notes for the early Nokia AMPS phones. There is a
possibility to supply a limited quantity of Nokia manuals to reliable
third parties, they say ;-)

Remember to relax on the holidays...Wally, this means your retirement,
too...:-)

2063. Re: Nicad Zapper

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-31 23:05:01 UTC
From: Ian Jackson <ianjackson@g3ohx.demon.co.uk>
Message-ID: <Xd0FqDAdSur5EwmV@g3ohx.demon.co.uk>
Source record: 58238

Always try to zap each cell individually. I use a normal battery charger - for a car battery, that is. Observe polarity, of course. However, do not use a high-current charger without adding something to limit the current to about 10 - 15A. Give a cell a one second zap (this is essentially a short circuit, so take care!!). There is a risk of the cell exploding if you over-do things, so take double-care!!!

You can assess your success as follows:
A whiskered-up cell will read zero volts before you zap it. After zapping, it will read some voltage - even as high as 1.2V - and should hold that voltage with very little sign of it dropping. Now slap a short across it (you can use a VOM meter on the high current range). The cell - even a fairly small one - will momentarily deliver a high current (say 10A for the D or U2 size). The current rapidly drops to more-or-less zero. Now re-measure the volts. The voltage will be very low but, if the whisker has been blown, it will gradually creep UP. If the whisker is still there, it will stay low (and fall even further).

If, at first, you fail, you can repeat the zapping a few times - but BE CAREFUL. The cell may be getting hot, and there is an increased risk of it exploding.

If you seem to have been successful, give the cell a good charge, followed buy a full discharge to essentially zero. A further test is to remove the load and measure the O/C voltage, which should now show signs of creeping up. If it stays low, the signs are not promising.

I have had a very high success rate using this procedure. Some of the zapped nicads seem to have been cured 'permanently'.

Ian.

>work with a bigger battery bank is possible, but specifics will depend on
>your particular unit.

Actually, there's a bigger problem. Most small UPSes don't have adequate
cooling for long-term running. They are designed with a chunk of thermal
mass, plus the knowledge that the battery will last only (say) 5 minutes
at full load or 15 minutes at half load. This limits the maximum
temperature that heat-producing parts can reach.

If you put a larger battery in, you don't get more watts out, but you
do get more run time. Parts get hotter, possibly hot enough to damage
them. So you need to be prepared to add a fan, or increase the size
of heat sinks, or add heat sinks to things that don't currently have them.

Only "online" UPS designs are built to run the inverter continuously.

Dave

Has anyone come up with a RIT circuit for the Wilderness Radio SST QRP rig??? I actually have 2 of these now and really enjoy using them, but the receive filter is so sharp it's a bit of a problem when another staion is > 200 hz off from my freq.

I can see how it would be easy to open up the filter, but the ideal solution would be a RIT circuit.

BTW, I just added one of the $5 TiCK keyer chips to it ... what a nice addition to a great 'lil rig!

2072. Can voltage affect frequency alignment ?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-01 12:30:32 UTC
From: "sb1963_bis@yahoo.com" <sb1963_bis@yahoo.com>
Message-ID: <39AFA168.87E14B7@yahoo.com>
Source record: 58147

I noticed that my Sony ICF-SW7600G was very well aligned when I was using it with regular alkaline batteries. When using SSB on AM signals, the "fine tune" wheel was always almost exactly in the central position with the display showing the frequency of the transmitter.

Since then I have switched to rechargable batteries. Recently I have noticed that in order to tune an AM signal using SSB and to keep the fine tune in the central position I need to tune the radio 1 kHz below the stated frequency of the transmitter (for example if the transmitter frequency is 9680 kHz, I have to tune 9679 kHz). Could this be becuase rechargable batteries deliver approx. 1.2V per cell instead of 1.5V? Or is my radio going out of alignment for some other reason?

Thanks.

2073. Re: Can voltage affect frequency alignment ?

Newsgroup: rec.radio.amateur.homebrew

Source record: 58149

It depends on the circuit design of the radio. One would expect there would be voltage regulators on the oscillators that would compensate for the lower battery voltage - but you never know. It could be that because you are starting with a lower voltage, the regulators will quit as the voltage drops more. I'd try a set of alkaline batteries and see if the problem goes away. If it doesn't then you know that the receiver needs realignment (which is also quite possible with component aging).

Well, the data is shown in the handbook, and you certainly need this
to make adjustments in the rig. Not only is the BW important, but the
lowest pass frequency, too

It is one fault in the RX audio amplifier, must change a capacitor
value and the receiver sounds very much better then

Well Rick,
To answer your question:
211 aka VT-4-C is 100 wat max Plate disapation, 1250V max plate
volts and 175 MA max plate current. Find this info in ARRL HDBK
from 1960 and earlier.

Now for the really good news my 160 meter transmitter is an old marine radio
RMCA ET-8010E, moved to 160 meters using two
in the final with 1250 volts and 400 MA plate Current (320 for the
finals) rest for the 2 807 osc/buffer tubes) I get about 200 Watts
AM phone. They work great. Alas as mentioned they are becoming
scarce. Use those of the 813s.
good luck es 73 Jim WB2FCN

>
>
Is the hum you hear independent of the frequency you tune or not?
If it depends on frequency, you will detect it in multiples
of the switching frequency and it can be radiated by the wires used to
connect the power supply to the outlet and the radio.
The cure can be to enclose the power supply in another conductive box
and put common mode filters in series with the input and output, all in
the box. The inner box (power supply) must be isolated from the outer,
except by a connection near the place you use to access the wires.
The wires must enter the box by means of feed-through capacitors.
This can be one solution for your problem.
Good luck.

2082. Heath SB-401 Power Transformer Info Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-02 01:23:32 UTC
From: Douglas Snowden <snowden@peoplepc.com>
Message-ID: <39b0554e@flexnet239.uunt.net>
Source record: 58158
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

I have an old xfmr from (I think) an SB-401 transmitter. I want to use it to build a power supply. Can someone help me with the voltage outputs? To verify that this is what I have, the number on it is 54-198 and 10977315. The wire colors are somewhat difficult to tell what they are (probably faded. They look like:

Black
Yellow/Black
Red
Red/Yellow
Blue
Yellow/Red
Orange
Green
Yellow
Green/Yellow
Red/Black
Green/Black.

It looks like the black and the yellow/black are primary. I looked in an old handbook
to see what the standard colors are, and most of these are not mentioned.

Thanks in advance,

Doug

I have a Relcom M6H doubly balanced Mixer.

It has a range of .002-12 Mhz on the RF port,
DC-12 Mhz on the IF port, and a LO injrection of 7dbm.

It is in a 8pin "relay" enclosue.

Would anyone know the pinout of this mixer?
I plan to make a VLF converter with this baby.

Thanks in advance.

Mike N2MS

I have'nt been to RS for some time -- the one local to me has always been a graoner, but I stopped by to get my :Cue :Cat and pick up their catalog - 444 pages and an enormous amount of stuff, including some interesting and fairly priced test equipment, an assortment of soldering irons/stations, etc.

Is this a new look or have I been away for too long? Looks like some aggressive restructuring to take advantage of a fairly widely distributed market. It's still RS, but if they can bring off this change it may actually produce some interesting results.

Look forward to seeing what people in this NG can do with the scaning device - speed sensor, gear tooth detector, beam direction sensor, etc. A couple of hackers posted some code to read the PS2 keyboard input, but were promptly shut down by overnight FedEx letters from Digital Convergence's high-powered lawyers compaining about intellectual property infringement and threatening a whole mess of whoopass.

2087. What is field strength?

I am using the circuit located at
http://www.mitedu.freeserve.co.uk/Circuits/RF/sfsm.htm

and it produces a result when located near my simplified AM transmitter @
http://www.pc.clara.net/radio/index2.htm . But what is it acually picking
up? Is it a magnetic or electric result, is there a relationship between the
distance from the tranmitting antenna to the result obsevered on the meter.

When lengthening the antenna coil the range of the transmitter is greater,
in a scientific context how is this so?

Thanks for your time.

I can remember a pre-Tandy Radio Shack that was geared to the needs the Radio Amateur. All kinds of radio parts, etc. They even had their own proprietary line of transmitters and receivers at one time.

I'm sure that the top management at RS has noticed all the 'little folks' making a living selling all sorts of unique whiz-bangs to a fairly sophisticated clientele and they have decided to steal a lunch or two...

Source record: 58174

In general, you can't increase the bandwidth of an oscilloscope without a complete rebuild. The limitation is usually in the deflection amplifiers, which need a very high slew rate to do the job. This can require a higher voltage source, faster amplifiers, and better layout.

You will also need a faster sweep circuit to view the waveforms. Further, the intensity may have to be increased beyond current capability so that you can see the trace as it whizzes by on low duty cycle waves.

Some exceptions exist perhaps, units that are capable of higher speed but the manufacturer chose not to take advantage of the capability due to cost or other constraints.

One alternative is to create a sampling circuit, also not a trivial project. Sampling is an excellent way of getting as much bandwidth as you like with as slow an oscilloscope as you want. Thus all the high speed circuitry will be working at low levels; the output of the module will be a low frequency that your 'scope can view.

Bob is right. Add to the problems the one of triggering.

It's kinda like converting a VW Rabbit into a BMW. You drive the Rabbit up. Take off the radiator cap. Drive the Rabbit off and a BMW underneath. Screw the radiator cap onto the BMW. You could possibly use the same principle by gutting the whole thing except the CRT, then building a 30 MHz scope into the box. But as Bob pointed out, the CRT might end up being too dim, so you'd have to replace it, too. Or you'd find its deflection plates have too much capacitance to easily drive at the higher speeds.

>Can anyone guide me to a relevant project?

My guess is that the tube vertical sensitivity is in your case about
40 V/cm, requiring at least a 200 V power supply. The manufacturer
apparently selected the 5 MHz bandwidth, since that could be done with
more or less standard television video driver.

However, to get 30 MHz, corresponding to 10 ns rise and fall time,
would require quite a robust stage. A 200 V swing in 10 ns into a 10
.. 30 pF load requires 100 mA .. 300 mA of current, which is not very
nice with 200 V power supply, since the driver dissipation would
become quite large, even if a complementary emitter follower stage is
used to drive the plates.

However, if tube vertical sensitivity would be in the order of 4 V/cm,
it would be much easier with 20 V supply voltage and 10 .. 30 mA
current demand into a 10 .. 30 pF load.

1) Usually you are not interested to trigger on the RF but audio
envelope on the signal, quite often I've checked for CW key-clicks.
When looking at an ssb envelope you don't care whether the RF is
sinewave or not. Important is that it is not too weak on the screen
I understand that it is some problems to do this properly, but if
input amplifiers are improved, is it still a lost case?

2) I am just curious, but I sold my Telequipment D52 scope a few years
ago (got $75.- for it - in fact more than I paid 20 years agoi!), it
claims 10MHz BW, but seems useful up to just 3MHz, I have some 100MHz
scopes, so no practical problems here

3) For simple checks I made a simple RF detector - rectifying negative
and positive part of the signal, fed the DC to a chopper and presented
a 50kHz squarewave signal on the scope's screen, it seemed to work and
Chris OZ2BB decided to rebuild his 432MHz SSB transverter... hi

My simple circuit was published in some different magazines around
1990 in DL, OZ and LA, and lot of feedback were rec'd via packet for
great interest then
It used 2x Ge diodes, CD4016 and CD4011 and a 2N3904(?), the detector
is very similar to the detector for "the Boonton RF Millivoltmeter
PROBE" as mentioned in another thread

I have a TSU-32 from them in some of my equipment. The tones follow a typical
binary-encoded pattern, with all 0's being 67.0 Hz and all 1's being 203.5 Hz,
with the other patterns being the other PL tones in order.

2109. Re: Need Relcom M6H Mixer info

Message-ID: <39B1A39D.6B403FF4@flash.net>
Source record: 58186

Hi Mike,
I looked up the pinout for the mixer today:
Looking at the bottom, with the colored glass insulator pin to the
left--that's pin 1. Pins 2,3,4 are inline with it, to the right.
Below pin 1 are pins 5,6,7,8, left to right. Pins 1,5 are LO; pins 4,8
RF input ; pins 2,6 are grounded. Pins 3,7 connect together for the IF
output. The mixer is a standard +7dBm LO drive; LO/RF are 2kHz-12MHz; IF
is DC to 12MHZ. The WJ logo is on top, over pins 1,2,5,6. Max Rf input
is a peak 50mW.

Good luck with the converter. If you're not an LWCA member, checkout the
LF converter on their webpage:
http://www.lwca.org/library/rcvg-lib.htm Consider joining LWCA!

I agree, Rat Sh*t is really getting its act together lately, for some reason. Their 2000 commercial catalog and radioshack.com site are both outstanding. Can't imagine it's all that profitable to serve the hobbyist community to that extent, but they're definitely putting out an impressive effort these days.

If you just need to look at 30 MHz signals you could simply convert the
30 MHz input down to 5 MHz with a mixer and suitable oscillator. The
ARRL Handbook used to have a circuit for this (might still have).

> not recommended paralleling them with 'real' lead acid batteries! Cos
float and
> other voltages can be different.
==========
'Wet' lead acid batteries can happily work with gel type batteries provided the end voltage does not exceed 13.8V (or 13.7 V to be on the safe side), this to keep the hermetically sealed gel type batteries healthy.

However at 2 - 3 months intervals the gel type batteries should be temporarily disconnected in order to allow the 'wet' lead acid batteries to be charged to 14.4 V .This exercise is keeping the wet batteries in top condition.
After their voltage has decreased (through usage) below 13.8 V , the gel type batteries can be re-connected .

I am running my station including desk lighting and lap top computer (with car kit) on 12 V batteries ie 4x 75Ah 'wet' deep cycle batteries located on a very well ventilated loft with a number of gel type batteries located in the shack , the latter also to provide occasional higher voltages for specific test equipment and experimentation.
Station comprises two 100 W HF transceivers , a TNC with 2m trx and some auxilliary equipment.
Total battery capacity installed 400Ah

In the near future all batteries will be charged with wind- and solar power . By then I'll increase the system load through a 12 V-DC to 230V - 50 Hz inverter , which provide a 'modified sine wave'
On the latter I would like to know whether it is possible to power the main PC via the inverter.
So far I have been told that this could be tricky since the non-pure sine wave form produced by the inverter could corrupt the Hard Disk even if the inverter has a the capacity which is 3 times the normal power consumption of the PC .

I would appreciate learning the experiences of those who are normally feeding their (non laptop) PC via an inverter.

BTW ,my main PC has a 420 Watts UPS (make APC) without a feature to connect additional battery capacity.
The UPS does a self check after say 2 seconds ie after the VDU has done its de-gaussing operation upon switch-on. This requires a brief high AC current ,which the UPS probably can not sustain.

TIA for any advice on the above matter.

We were talking about mast steps a while back and now I can show pictures of how I did it. To describe them briefly, I used a 3/4" waterpipe "nipple" which is 12" long, and put a cap on each end . This is the step and the caps keep your foot from slipping off.
To attach the step to the mast, I use a saddle from an old Mosley antenna and a stainless steel U bolt. The nuts are the type sold in hardware stores to connect threaded rod sections together, and are easier to handle/harder to drop on the towertop than a regular nut. I feel better having all that thread on there too, but it probably doesn't actually make it stronger. You can actually hand tighten them if a temporary mount is contemplated.

I made up 7 of these, and they work great.

Of course you should always take the usual precautions when climbing any tower or mast.

The pictures are located here (in order not to jam up the reflector):

2116. Re: Homebrew vertical insulatore and mounts DE K0FF

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-03 13:57:41 UTC
From: K0FF@ARRL.NET
Message-ID: <00dd01c015af$40682100$85c249d8@K0FF>
Source record: 58193

Here is a convenient way to use a combination of Uni-Strut, PVC pipe and U-Bolts for mounting and insulating HF vertical antennas, this slick and works quite well.
Uni-strut is available at Home Depot etc. It is a 3 sided square metal bracket with a series of holes in the back wall, and come is 10 ft. lengths. The front is open, and the sides are rolled over into the opening creating a remarkably strong structure. In it's intended role, it is secured to a wall or ceiling, and special clamps are inserted into the open side, and conduit hangers are attached with bolts.
A piece of this maybe 18 inches long serves as the adapter between the steel pipe in the ground, and the PVC insulated vertical antenna. Uni-Strut or sometimes called B-Line comes in several sizes, the 1-1/2 by 3/4 is OK for small stuff, but I use the more common 1-5/8 x 1-5/8 size for it's added strength.

Find a piece of PVC pipe about a foot long and a sloppy fit over your bottom antenna tube . Slit the PVC pipe all the way down one side with a saber saw, and make a second cut a fraction of an inch away, to widen the gap so that when you clamp it around the aluminum tube, the gap almost but not quite closes. 1-1/4" Schedule 40 PVC pipe is the perfect size for the RadioShack 5' TV mast sections. Various plastic plumbing tubes and pipe can be had in PVC, Poly, and ABS. All seem to be good insulators at RF, especially at the voltage node.

Drive a steel pipe section into the ground a few feet (use a posthole digger and concrete for a permanent installation), and leave 2 feet sticking up. Clamp the bottom half of the Unitsrut to the steel pipe with 2 s.s. Ubolts, made for 1-1/4 inch water pipe(a standard hardware store item). The round part goes around the steel pipe and on the backside of the Unistrut put the supplied flat backup plate and nuts.
Then do the same on the PVC covered antenna section with 2 more s.s. Ubolts.

This arrangement will automatically set everything straight in-line, as the round pipe parts seat into the open face of the Unistrut, and when clamped, everything lines up automatically.

I developed this method when installing my first Butternut antenna, which had only a pipe out the bottom with no kind of mount whatsoever, or even tips an making one in the manual! DUHH!
It would up being so useful that I use the same concept on any number of antennas now, including when I mount something on the mast top on the tower or making sidearms....
This trick of slitting the 1-1/4 in PVC makes a great adapter for using RadioShack masts inside a Ham M or HD73 Rotor, as the clamps won't go that small otherwise. Some Yagi-Uda antenna clamps are too big for R/S TV masting

and need spacers too (my portable-mobile is based on the R/s masts).
As far as the radiating element tubing, that a topic all by itself, and a great deal depends on the height, weather conditions, bands in use etc.

A lightweight 40M vert (FD style) can be made from one 10 ft piece of 1" Aluminum conduit slipped inside a 21 foot Fiberglas fishingpole, and a wire run to the tip.

PA-1 update:

With 800 mw from my RS HTX 202 (ugh)
(ever loose the manual to this radio? forget it ,,,,,,,here's another
company I won't complain about) into the PA-1,,,,,I get about 8 1/2
watts
out, ok, this is "10 times power gain". At high power setting though,,,,
5 watts in,,,,,,I get about 15 watts out MAX.
Why does this happen? this is no where near
the 35 to 40 watts AVERAGE POWER NOT PEP, boasted about in their
catalog.
It seems like there is too much gain and the
transistor is saturating, although changing the
components (you can't do this anyway it would be "modifying") has no
effect on the power out.
So far I have burned out about 5 transistors!
I guess I need a well stocked junk box with a
24 db gain 50 watt transistor! probably costing
twice as much as the kit!

2121. Re: a question about TenTec 1253 receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-03 20:23:37 UTC
From: Richard Crowley <rcrowley7@xprt.net>
Message-ID: <xpys5.16684$oH5.440231@news-east.usenetserver.com>
Source record: 58099

I just built a TenTec 1254 SWL receiver and found some annomolies. I haven't seen the schematic for the 1253, but if it uses varicaps for frequency determining parts of the circuit, my experience may shed some light (or at least amusement).

There were 3-4 slips of paper included with the consruction manual documenting changes to most of the diodes (varicaps and zeners). The zeners were so small they were indistinguishable even with their attempt at describing the physical characteristics. I had to rig up a test circuit to tell which voltage values were which.

And with the vaircaps they use for the (two) LOs, the substitute diodes seemed to have a very different range of cap vs. voltage than the original devices. When I followed the instructions in the manual for adjusting the inductor in the LOs, they stopped tracking the frequency at about 2/3 of the range (ran out of available control voltage). Only by adjusting the operating point several volts below TenTec's recommendation was I able to get the LOs to run throughout their intended range.

I was suprised that no mention of this was made in the errata sheets for the diodes.

Our club has a Collins KWM-2 in a quite decent condition, and
it is a delight to work with on SSB, but that 2400Hz (2600Hz?)
filter is a bit on the wide side on CW.
Has Collins manufactured their mechanical filters for 500-800Hz
passband?
(Yes, one could use xtal filters etc, but it would be tasteless
to modify a classic radio :-)

>Fair comment.
>But why have the item in the catalogue if you DON'T STOCK it ?

Because they are moving into mail order for components. I doubt
they'll last long though - CPC are cheaper and of course the surplus
folks even cheaper still. The sad thing is the catalog used to be a
wonderful 'index of possibilities' with its detailed description of
each IC - let's hope that they keep that going as they move to mail
order.

>but he had nothing to do with actual components other than PIC chips or
>similar
>devices, you want an oscillator you just tell the chip it is an oscillator !

Its cheaper to use a 555 for an oscillator, for a dual oscillator a
PIC12C508 is probably cheaper than setting up a 556, and you still
have pins uncommitted.

FWIW I can set up an oscillator on a PIC faster than setting up a 555
- and of course if I want PWM or variable mark/space etc on the PIC
I've got it. Setting up logic ICs requires similar skills to
programming so the move to microcontrollers ought to be
straightforward for most folk. Once you've flashed your first LED on a
PIC you're away. The nice thing with PICs particularly is the
programming envirionment is straightforward and free and making a
simple programmer requires only 2 diodes, 2 caps and 2 resistors (I
think - check out Ludipipo on the web).

>Well roll on 2002+ when the CODE has GONE the RAE is no-more and
>we all using TYPE APPROVED equipment by law.

I hope not - I expect the gradual loss of thru-hole parts will
actually cause the demise. Interestingly the North California QRP club
(NORCAL) have already kitted one basic QRP transceiver as entirely SM
and have an all singing SM transceiver in the pipe. Problem with SM as
kits is it is hard to buy SM in multiples of one and there's a pretty
good chance you're going to drop (or ping from tweezers) some
component during a kit build. I believe the cosmonauts on MIR figure
if something drifted out of sight it was considered lost because there
was so much clutter up there - SM (alright, even hole thru components
- even pots and large switches sometimes) are similar in my shack!

The comment of a local Maplin store was,
"If it stays on the shelf for a couple of weeks, we don't restock it".
You may like to try my local electronics store who are always helpful.
They operate mail order service I believe. (Check an electronics mag.)

From: Ralph Mowery <rmowery@dialpoint.net>
Message-ID: <39B4E767.FF96E888@dialpoint.net>
Source record: 58109

The 6SN7 was an older tube that had a big 8 pin octal socket and was replaced with the 'newer' 7 and 9 pin miniatuer types. While the nuvistor was a lot newer and smaller design , they were mostly made for radio frequency applications. The 6AU6 was probably one of the most common tube types used. The nuvistor was not a very common tube used in comsumer equipment and is usually harder to find.

Martin John Hallsworth (Martin@g1gyc.demon.co.uk) wrote:

: But why have the item in the catalogue if you DON'T STOCK it ?

I believe that "non stocked" items are still available by mail-order - the costs in keeping every component stocked in every shop would be phenominal - particularly when somebody comes in for one 47 ohm .25W resistor. one 6.8V zener and a 0.047, 100V capacitor - this is where the mail-order specialists come in, and the like of RS Components, Farnell, etc. all have minimum quantities.

: Hmm .... world economics or some other such like statement here.

: >I just wonder where the next generation of electronics engineers will
: >come from - there already appears to be a shortage and it can only get
: >worse.
: >
: They are already here !! they are called SOFTWARE PROGRAMMERS !!
: I recently spoke with a young man doing his degree in "Electronic
: Engineering"
: but he had nothing to do with actual components other than PIC chips or
: similar

Well, having worked for a large electronics company, it is so noticable that the output of so many universities cannot use a 'scope, soldering-iron or even a screwdriver properly.

: Well roll on 2002+ when the CODE has GONE the RAE is no-more and
: we all using TYPE APPROVED equipment by law.

Commercial equipment may need to meet minimum specs, and that's no bad thing, but home built equipment should be exempt. That's the situation in the boating scene - a home built boat is exempt from the RCD (recreational craft directive), but it is illegal to sell it until it is five years old.

: That's my last word.

Bye

Hello all,

I have for sale NOS Svetlana tubes :
GI7b - 25 USD or 47 USD for the pair.
GU74b - 75 USD or 145 USD for the pair.
Socket for GU74b - 30 USD.
GU84b - 90 USD or 185 USD for the pair.
GS31b - 50 USD or 95 for the pair.
GS35b - 75 USD or 145 USD for the pair.
Please not that all prices above are WITHOUT shipping price.
All tubes will be 100% tested before ship.
For more info please mail to : r.vaicius@omnitel.net

Required, this is make 2 off EHT sample units :-
8off 1Mohm 0.5 watt High Voltage resistors
Maplin Code V1M

2off 1Mohm 1 watt resistors
Maplin Code No longer stocked (*1)

2off 6M8ohm 1 watt resistors
Maplin Code No longer stocked (*2)

2off 270Kohm 1 watt resistors
Maplin Code No longer stocked (*2)

2off 100Kohm 0.5 watt resistors
Maplin Code M100K

4off BZX61C56 1.3 Watt Zenner diode
Maplin Code No longer stocked (*3)

2off RED LED
Maplin Code WL84F out of stock (*4)

That was my shopping list !! nothing exotic there (so I thought)
right now I have calmed down :-
*1 = 2 watt as alternative will do.
*2 = 2 watt as alternative will do [NOT preferred value !!]
*3 = alternative arrangement could be 4 zenners of a
lower voltage say 27V for each unit (108V verse 112v
*4= Any LED is useable - but I had lost it by this time

So I will get the High Voltage Resistors and look round at Telford
for the rest then if that fails it will be Mail order.

73 and thanks for your comments Martin G1GYC

Alan
well I just learned something -

Don't turn off message headers because they contain the list of
cross-posts!!! I thought I was only posting to uk.radio.amateur

My remarks were very tongue in cheek. I am, and have been for some
years, a subscriber to your magazine. I've designed a couple of PIC
projects (and meant to write them up for publishing consideration) and
just built the K2 tranceiver kit.

I get asked by my local radio club to provide a couple of projects for
our 'warm iron evening' once a year. These are usually very simple so
they can be completed in the evening (PICs come in useful here) but
amazingly popular. There is no doubt that folks get a big kick out of
building. I think I ended up kitting about 60 kits last year.

It's been interesting to see how your magazine has coped with the
change - the high percentage of PIC based programs must have caused
consternation amongst some readers.

One further nail in the hobbyist building coffin is the high level of
sophistication we all display today. A pair of flashing LEDs or even
electronic dice just doesn't hold the fascination it did 15 years ago.

Hi,

Sorry if this is the wrong news group, I wasn't sure where to turn.

I'm looking for an AM/FM tuner module that I can control from a PC / microcontroller - not a TV tuner card. A unit designed for microcontroller based a car stereo would be ideal.

Ideally I want antenna, power and data in and L&R audio and RDS out - kind of thing

RDS support prefered. Philips used to make one call OD5604, but they discontinued it June this year - sob sob.

Any pointers welcome.

James

Someone recently gave me a pile of recent editions of your mag,
and I was amazed - several thought-provoking articles with
modern components. Keep up the good work!

Long gone are the eternal astable multivibrators that seemed to
be the heart of every project a few years ago, and were the reason
for avoiding your mag like the plague.

I would go so far as to suggest that (Electronics &) "Wireless World" has
gone so far down hill that your publication deserves the centre stage.

HIGHLY RECOMMENDED!

2146. Control grid voltage or resistance?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-05 19:43:49 UTC
From: Rick Haub <rhaub@midwestmicro-tek.com>
Message-ID: <39B54CF5.353B6DE3@midwestmicro-tek.com>
Source record: 58126

I've got the 1967 Ameteur Handbook and have built a transmitter and a reciever from the projects shown in the book so I have some skill with tube based units. Recently I came across an article from a 1952 Practicle wireless that described a 5-10 watt 80, 40 and 20 meter transmitter using the 6ABJ. I liked the design and would like to use it for QRP work but I decided to make it a junk box project.

I don't want to spend a dime on it if I don't have to but just use parts I've been scounging for some time. Most of the parts I have but I don't have the 6ABJ. I do have some other triode/pentode tubes though and I have the tube guide in the back of the Handbook and the tube data on www.duncanamps.com but this led to an interesting delema. The Control grid for the 6ABJ is given in -volts but for some others like the 6AU8 (I have one of these and would like to sub it for the AB) it gives a resistance value at maximum load.

How do I compare these values so that I can recalculate for the various biasing resistors?

Rick KC0GIX

If you get a cb handheld that can hook up to a base antenna you should get
out better than the built in antenna or rubber duck.

I pondered the subject of CE approval of constructional projects a while
ago, as some people were trying to fret us into thinking that all our
projects must suddenly comply with the Low Voltage Directive etc. Since
we have no control over the parts used, or individual standards of
soldering, or in fact whether they will even use an enclosure at all,
that was good enough for me. Doesn't bear thinking about! {-)

Hi,

The simplest one I've seen was a CD4060 14-stage divider chip with a crystal strapped across the oscillator section. A U.S. 3.58MHz tv colour burst rock would work fine if the 4060 had the divide by 11 connection brought out but it doesn't have unfortunately. The reset pin of the device, driven from the PTT line through an RC network, could probably be used to provide the burst timing.

As far as I can tell fall off is normal. With my 202 (mine is a brick, just keeps running and running) connected to my RS 2 meter amp, I get about 18 watts from the low power setting on the 202. When I run the 202 from the battery pack and put 5 watts into the amp I get just over 30 out. When I run the 202 off car power and get closer to 7.5 w into the amp I get just over 40 out.

If you are blowing output transisters, you may just have a terrible match to the antenna and are blowing the finals due to high swr.

My amp never sees more than 1.1 swr and I wouldn't risk overdriving it to 40 watts if it saw even 1.3-1.5.
thanks, John.

Hi to all,
Does anyone know of a supplier for high power Non-Inductive resistors in Australia?
Hopefully power handling up to something like a 100 watt for use in a dummy load (50 ohm), grid driven amp (50 ohm), and terminated rhombic (800 ohm).
Thanks in advance
Noel

Peter, this may be of limited help, but some decades ago a repeater in the USA
of which I was a member installed a 1750 Hz tone burst. I had a portable
railways VHF set with no way to add tone, but got by with a _very_ small mouth
organ glued to the top of the microphone. One of the reeds was the right length.

Good luck!

Thanks Frank, also Mainline Surplus Website is at
www.mainlinegroup.co.uk
and has a downloadable DBF or ZIP inventory list

excellent for RF bits and bobs, but I don't like the prices of certain
devices in their list, I get the feeling they are pricing at UKP to
USD direct equiv., cheaper to go the Digi-Key and other US on-line
Radio Amateur stores.

No, if your computer has just the older PCMCIA bus, then it will not work. Cardbus is actually a form of the PCI bus, and requires the newer PCMCIA sockets.

However, if your laptop has a Pentium II or Pentium III processor and was built within the last 2 - 3 years then there's a good chance that your computer will support this card.

I bought a Yaesu FT8100 about 1.5 years ago and found that in both of my vehicles (Ford products) I was picking up what sounded like alternator whine, well I tries various remedies suggested in the newgroups and nothing worked! I finally had enough one day and played around with the radio and an HT only to find that the noise was getting in through my antenna coax. The simple solution I came up with was to wrap the coax around a flyback choke I pulles out of an old VGA computer monitor....about 8-10 wraps did the trick and I've not had the problem since! Hope this helps someone out there with the same pain-in-the-butt problem!

>from - No one on the high street will stock components any more !!
>
Martin
I haven't used the high street for PICs ever. Several UK
suppliers have significantly lower order prices than Maplins or RS and
next day delivery (FWIW I usually use Crownhill for PICs)

Maplins were useful (still are to a lesser degree) in the ability to
pop-down on Sat or Sun morning for that missing component for the
weekend project but you did(do) pay for that convenience.

They still mail order as do Farnells, Electromail, CPC and a load of
surplus dealers (I have used Bardwells quite a lot). Go buy Everyday
Practical Electronics or Elector for a list. If you can't find what
you're looking for there go check Mouser or Digikey in the US, Dick
Smith in Australia, Kitsrus in Hong Kong or any of the other suppliers
on the web.

Not particularly singling out the names here - just ones I've either
dealt with or looking into dealing with- I'm sure there are hundreds
of others out there who I've yet to discover - emailed price lists or
pointers to web site will not be considered junk mail :-)

12au7 should do. 6sn7 is still being made new (and there are lots of good used around for cheap) if you want to use the real thing.

==========
Don't know anything about the Aussie electronic components supply situation
,but am aware of modern compact non inductive thin film resistors in TO-220
package .
Although they are made among others by Craddock - Riverside California ,
they are widely available .
You even find them at Amateur Radio Rallies.
They are named 'MP Kool Tab Power Film Resistors' , max. dissipation up to
20 Watts in various resistance values
from 1 to 10000 Ohms.
They are excellent for dummy loads provided they are fitted to heat sinks
(a metal chassis can serve as heat sink) For power ratings in excess of 20
Watts you obviously need a number of devices.

They are more stable than the traditional carbon resistors.

Mainline - Leeds ,England can supply the following values : 25 - 50 -100
Ohms ,other values
on special order.
They claim their items can dissipate 25 -35 Watts and that they are good to
300 MHz minimum.

I have no other interest in Mainline than being one of their satisfied
customers.

2177. EHT rectifier

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-06 14:33:01 UTC
From: Frank Dinger <gm0csz.kn6wh@invertain.freeserve.co.uk>
Message-ID: <8p7q8b$b3j$1@newsg3.svr.pol.co.uk>
Source record: 58074

Some time ago I purchased from a surplus dealer 4 pcs Marconi - Lincoln , England ,
EHT rectifier ,model HTZ 24B

It is a half bridge (hence 2 units form a full bridge rectifier) ; each unit has 3 screw connections
When increasing the forward bias voltage a current commences to flow when voltage is 12.4 V or 6.2V for half the unit . This suggests that inside the moulded unit are 2*(8 or 9) silicon diodes ,meaning that if the PIV for each diode would be 1000V ,the PIV for 1 rectifier leg is 8000 - 9000 V .
If the complete unit is used as 1 leg of a bridge rectifier the PIV would be 16000 - 18000 V.
The model happily survives a constant current of 500 mA - DC.

Marconi -Lincoln is now named Mitel Semiconductors

Can someone perhaps identify this rectifier and provide info on specified PIV and current rating.
It is my intention to use the units in the HV power supply unit for a HF RF valve (tube) power amplifier .

TIA Frank gm0csz.kn6wh@ukrs.org

They say don't kick a man while he's down, but can you think of a better
time?
I cant resist the temptation to have a go at Maplin.
My local Maplin (Leicester) used to be OK, but in the last few years has
gone seriously downhill. There are supply problems, but no-one is interested
in supplying small numbers of small parts to hobbyists anymore; there's
clearly no market and you cant blame them for that.
However, the place seems to be run by spotty-faced school-boys few of whom
has been to charm school and absolutely none of whom has the least knowledge
about electrical or electronic equipment.

> biasing resistors?

What's a 6ABJ? -- doesn't sound like any tube numbering scheme I know
about.

It's easy to convert between grid bias voltage and cathode bias
resistance: Rk = -Eg1 / Ik (remember, Ik = Ip + Ig2). That won't help
you in your case, however, since the databook values for Eg1 and Rk are
for class A operation, and your tube is almost certainly running class
C in a CW transmitter. Both tube stages are also probably using grid
leak bias rather than cathode bias. If you have the right tube data
you can calculate the biasing components properly (See e.g. the RCA
Transmitting Tube Manual <TT-5?>, reprinted by Antique Electronic
Supply), but receiving tubes such as the 6AU8 never have the data you
need to use them for class C. Your best bet is probably to use the
same component values as in the original plans, and/or look at other
similar plans to get a feel for component values. For low-power stages
the grid leak resistor seems to generally run 27 to 47k.

LBNL, I don't see how you can get 5-10W out of a 6AU8; it's just too
small. I think you'll need a slightly bigger tube, e.g. 6GV8, 6HZ8,
6JE8, 6T9. These have pentode sections that run 5-12W plate

dissipation. I've got a little 6HZ8 transmitter on a Radio Shack minibox here -- just waiting for a few items to finish it up. Should be good for about 10W input.

Joh I was interested to read your article on my
return from holidays.

I understand your frustration but I don't know of
ay other high street location that you could buy
these types of items.

Maplin is consolidating its range of products but
I can assure you that componenets are n essential
part of our business.

Checking on our website will tell you if we have
any warehouse stock (www.maplin.co.uk)

Come on give us guys at Maplin a break. Yes if someone wants to
buy one CD holder its 99p but you can buy a 5 pack at £1.99 (BV65)

As for charging for the catalogue the money off vouchers
can soon make the catalogue effectively free.

It's easy to find the odd product and make fun, but at least we are
still on the high street for the electronics specialist. Sure some
mail order is cheaper but they don't have to pay rates and staff costs
for shops (and its harder to go back and complain).

Maplin stores are not franchised and the only reason that you may find stock better in one location than another is the profile of the local commnity. At Maplin we have computer systems that looks at demand on a shop by shop basis, and gives or takes away items accordingly. So if there is no demand in slough then unless you request it little or no stock is kept. Each shop starts off with a model shop profile. We do also keep items in stock in all stores irrespective of demand which are deemed to be vital.

I'm sorry that you think so badly of us here at Maplin.

ok so no 2.2uF capacitors in stock, it's posible someone had recently bought them. ow many should we stock ? howevere many mutiply this by the number of components and the numbser of stores and it soon mounts up. We do try (and fail sometimes) to get it right.

CPC are a very competative company but have no shops to pay for and very few staff to keep. Interesting prces that you have got for scart leads !!

It's true that on some items we will be expensive and other items cheap but isn't that the way with evey company? If not we would all go to the same place to shop.

I was under the impression that Litz wire is woven to make each conductor go into the bundle and emerge to the surface from time to time. Simply twisting insulating strands won't have the same effect. Has the person who suggested twisting the wires with a drill compared the result to ordinary insulated wire, or to conventionally made Litz wire?

If I remember correctly, my old Heath Sixer and Twoer used a 6AU8
in the output. The outputs were run Class C and were usually
operating at about 6 to 7 watts input. This would figure out to be
about 5 watts output. I would be skeptical about much more than that.

It was common practice to substitute a 6AW8 and change some of
the resistors to squeak out another watt or two.

I'll have to pull them out and see if they still work.

Hello folks,

I would like to find out details of a metal valve used in English, UHF receiver. Its a well build commercial receiver, the young amateur owner is seeking more information about the valve.
he believes it may be a variable-mu IF tube.
The receiver covers 500 - 900 MHz approximately, and has also an acorn tube.

Thanks for any helppful replies.

Winton ZL3AO, Christchurch, N.Z.

My 1945 reference provides some more numbers but no commercial equivalent,
as follows;
CV 1136
VR136.
Army # ZC/10E/386 and ZA15442
Air Ministry # 386
Gov. Spec. MAP (Ministry Aircraft Production)
Descrpition Pentode. (No mention of what type of pentode!)
Maybe a UK compatriot has the 'specs'.
Sorry no more help than that.
Regards from Terry Sanford. Newfoundland, Canada.

The original suggestion was to twist a small number of wires into a group
and then twist multiples of those groups together - that sounds as if it
would achieve the objective.

No - what you've made is "wire rope" which has most of its strands
permanently on the inside where the skin and proximity effects prevent
them from carrying much of the total RF current.

As Roy said, genuine Litz is *woven* or braided, in a complex pattern
that periodically brings each strand to the surface. This is the best
that can be done with multi-stranded insulated wire, and at low
frequencies the losses are lower than the other alternatives.

But it must surely require a highly specialized machine to weave genuine
Litz - more like textile machinery - so a lot of modern "Litz" is
actually just "wire rope". It won't give inductor Qs as high as the old
handbooks say, because the originals were probably measured using the
real thing.

OK, I can generally follow British English quite well, but am a little confused by the term "high street location". It seems to mean a store that caters to the public? Is this as opposed to either a mail order store, or one that is located in say an industrial area, only serving industry or business?

Chris

Winton: Further, overnight!
For some reason the valve numbers EF54 or EC52, also keep popping into my head! (Mullard based valves developed for high frequencies and better gain etc. in the 1940s.)
I think these were also 'metal can' type tubes (apart from their otherwise 'all glass' construction with the base pins embedded in the glass it self, compared to, say, to octal based tubes where wires are soldered to metal pins in a plastic base.)
If memory, after 50 years or so, serves me, these were similar to the famous (often red) EF50. All of these had a special 9 pin base.
I don't think the VR136 is anything to do with another well known WWII valve, the SP61. Which for some strange reason is not listed in my 1945 "Common Valve List" although the SP41 is! The SP61 was/is a glass tube with a 'Mazda Octal' base and a biggish top cap, it had also sprayed on grey metallic coating.
Hope this doesn't mislead. But airing the discussion may lead to better info by someone knowledgeable.

Good luck.
Terry S.
PS. Sad isn't it when one 'dreams' about valve/tube numbers!!!!!!!!

2201. TC9111BP PLL specs

I used to use a design by (from memory) G8BTC. It was very simple.
I seem to recall it was a single CMOS IC (4011 springs to mind).
The design appeared in TT around 1979/1980 and worked very well
for me. I built mine on a piece of Veroboard and installed it
in an old Trio TR-2200G. It worked by pressing the PTT twice in
rapid succession at the beginning of transmission when you needed
the burst.

I naturally haven't seen or used the circuit for many years as
firstly, repeaters over here don't use a toneburst, and secondly
I very rarely operate FM (nearly all SSB in the car now).

Hi,

I agree that the the objective of Litz wire is that every strand has its turn in the middle but I would think that "wire rope" would achieve that fairly well. If there were six groups (each with 6 strands) of wire twisted together so that all of the groups were on the outside then each individual strand would go from being on the outside of the rope to being on the inside. It may not be quite as good as the traditional Litzendraht wire because each strand will always be adjacent to the same other strands but it probably would achieve most of the benefits.

cheers

kevin white

I wish you luck. I had occasion to try to get spec for their TC9122.
E-mails to every Toshiba office brought no response, not no useful
response, NO response. Eventually I phoned Toshiba in Japan and
requested data, I was told it was a discontinued device and no data
was available. This is for a product that is still being produced.
.. I for one will, in the future, never specify Toshiteba devices for
any application whatsoever.
Fortunately I was able to get the spec from other sources.

Peter,

If you are going to be connecting this into your microphone input you probably want something that produces a nice clean sine wave and is fairly stable.

Something simple, like a 555 timer, could be used with a simple low pass filter. You would get reasonable stability and the low pass filter would help attenuate any harmonics.

But the circuit that comes to mind is a simple Phase Shift Oscillator. This kind of oscillator is very stable and produces a nice clean sine wave. Construction should be simple and would only require, at most, a dozen parts.

For a little turorial on how a Phase Shift Oscillator works you might try "http://www.sound.au.com/dwopa.htm" and click on the link that says "Phase Shift Oscillator". The author presents a diagram and equations for selecting proper part values.

You can also look at:

http://ourworld.compuserve.com/homepages/Bill_Bowden/

there is a link under "Analog/RF Circuits" that for a "Low Frequency Sinewave Generator". Coupled with the other description you should be able to adjust the circuit values for 1750 Hz. The oscillators described are designed to run on 6 to 15 Volts.

The only thing you might add, that's not on the drawings, is
a volume control.

From the looks of all the diagrams all the parts should be
easily available at any Radio Shack or Maplin store.

Well, Good Luck

2212. The K0FF 5/8 40M antenna with picture links

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-07 16:42:17 UTC
From: K0FF@ARRL.NET
Message-ID: <02d701c018ea$f5893e00$bcc249d8@K0FF>
Source record: 58088

The 40M 5/8 antenna (225 degrees) is arguably one of the best transmitting antennas ever. I say "arguably" because there is a lot of argument over it. Some say it's nothing but a 1/2 wave with a little extra (which of course it is), and some say it's a 3/4 with a little less (also true). Recent computer analysis points out that the radiation angle can be severely affected by an inadequate groundplane, and in reality it's no better than a 1/4 wave.
Nonetheless, I've always romantically thought of the 5/8 as the ideal, mostly because in the AM broadcasting industry it is considered so (and so did John D. - in his 1st book).

This is a description of the mechanical details of the antenna that I built and use. The radiating element starts out with a Rohn HDX56 tower. On the rotor plate I installed a 1-1/2 inch plumbers pipe flange.
On the top plate, where the thrust bearing usually goes, is another pipe flange, but the threads have been removed on a lathe, and set screws installed on 3 sides of the lip. Into this is slipped a piece of 1-1/2 inch waterpipe (threaded on both ends) of about 10 ft in length, and it is secures by screwing and clamping the flanges. At the top of the waterpipe I installed a reducer from 1-1/2 to 1"and put a 2 foot nipple in there. The transition was tightened, drilled and thru-bolted.
This gave a secure mounting point of the proper diameter for the next section, which starts out with the insulated base from a defunct Cushcraft AP8. The insulator was retained (for future insertion of a motorized loading coil), but shorted out with straps for this project. From there on up, I just added enough tapering aluminum tubing to bring the total length up to around 85 feet.
The thing needed to be pruned during installation, because there is no way to determine the effect of that radical a taper beforehand - more on that later.

Tower picture showing telephone pole "fulcrum" use when tilting the tower :
http://homepages.dstream.net/K0FF/5-8Fourty/etower.jpeg

The rest of the tower sections are assembled, and all the joints are doped with electrical goo, before tightening.
Now the interesting part - how to hold all that up in the air, freestanding, and insulated it from the ground? Well I did it by using two 1/4" steel plates, each 8" square, held apart in a sandwich of 4 electrical insulators .
One sandwich for each of the three legs. A hinge base kit is bolted to the top plates, and the J-bolts in the concrete go into the bottom plate. These are the red plastic insulators about 2-1/2 inches in diameter, 2 inches tall, and with a 1/2 inch metal thread at each end, made to hold

giant buss-bars and feeders in electrical distribution panels.

Base detail:
http://homepages.dstream.net/K0FF/5-8Fourty/eInsBaseClose.jpeg

Exploded parts picture depicting a variety of surplus insulators:
http://homepages.dstream.net/K0FF/5-8Fourty/eInsulatorparts.jpeg

The J-bolts have a lot of thread on them, so I first added one nut to each and tightened it down almost all the way to the concrete. Next is slipped on an aluminum disc that will receive the radials and groundrod connection. This disc is thick aluminum and is 1 meter in diameter, with forty quarter inch holes drilled around the perimeter. Another nut on each J-bolt secures this in place, and then the leveling and top nut for the insulator sandwich.

Radial plate:
http://homepages.dstream.net/K0FF/5-8Fourty/eRadialplate.jpeg

To facilitate raising the tower, I installed a wooden telephone pole in concrete, about 2 feet from the tower base, and in the direction opposite that which the tower lays. A heavy pulley at the 25 foot level, accepts a 5/8 inch rope, and the lawn tractor does the pulling. To protect the insulators during the pulling up phase, there are some extra holes (slots) in the steel plates of the sandwiches. These allow short pieces of pipe to be thru-bolted in place between the plates, taking any strain off the insulators. Quite a few up-and-down cycles were anticipated during the tuning stage, but a little mathematics helped the task be accomplished in only 2 times.

Also as an added precaution, some guy-points were built into the tower structure. These are 3 inch long pieces of UNISTRUT, cut so that one of the running holes is in the middle of the section. They are bolted on vertically at two levels on each leg. Then they are cross drilled to accept a 1/2 inch SS bolt, and the Dacron guys with thimbles are slipped in and the bolt secured with a NYLOK nut.(Nylok nuts have a nylon insert that effectively
locks the nut onto a bolt, so that no lockwasher is needed).

Guypoint hardware example:
http://homepages.dstream.net/K0FF/5-8Fourty/Guypoint.jpeg

Closeup view of a Nylok nut:
http://homepages.dstream.net/K0FF/5-8Fourty/Nyloknut.jpeg

Now the thing is up, and 40 insulated, tuned 1/4 wave radials lay on the ground. One third of them are cut for 40, one third for 80 and 1/3 for 160 (always anticipating!)
How do you tune a 5/8? It's not resonant. Well it IS resonant somewhere. All you have to do is figure out where.
Well a large cross section 1/4 wave (call it 2/8 if you want) vertical for midband on 40 should be 32.33 ft tall so 5/8 should be about 2-1/2 time that, or 80.8. A 5/8 works out to be a little longer than that because there is only one "end effect" to deal with. The math is simple - treat the

antenna as if it were a 1/4 wave on SOME frequency, and resonate it. Once that's done, all you have to do is match it to the feedline at the frequency that you intend to use it at.
Follow along: 7.1 MHz is actually 42.25 Meters, freespace. Multiply that times 5/8 (.625) and that comes to 26.4 Meters. Now what frequency is 26.4 meters a quarter wave for? Multiply 26.4 times 4 and you get 105.6 meters. That's the wavelength. Divide 300 by 105.6 and you get the frequency which is 2.846.
Just tune the antenna to 2.846 MHz using your favorite analyzer. Another shortcut is to first measure the length of what the antenna happens to be, then check the resonance frequency. Next prune the antenna by a measured amount, and recheck the resonance frequency. You can then easily figure the inches per MHz factor, and get the correct tuning point on the second try. Sure beats all that cut-and-try.

My antenna was resonated using this method, and then matched to the feed line which happens to be 75 Ohms in this case. A simple series capacitor made from a sandwich of doorknobs between aluminum plates, and a shunt inductor brought her right in. The tube amp is set for 75 Ohms so there is no mismatch anywhere, and the low-loss 75 Ohm TV cable is as good as hardline on 40, but a lot cheaper.

Matching network:
http://homepages.dstream.net/K0FF/5-8Fourty/eMatch.jpeg

Good building and be safe, Geo>K0FF

They work very well. You need about 58" for total height. (less mounting stub, if used) If you can get that in your attic, you've got it made.

I too, have very limited antenna space, though no specific restrictions. (I live in a townhome) I built the copper pipe J-pole as described a number of places on the web. Only difference was I used a couple of turns of coax through a ferrite toroid for the RF choke instead of the air-wound coax. I borrowed an MFJ antenna analyzer to adjust the feedpoint. The final SWR came out to 1.12 to 1, with an antenna impedance of 47 ohms at 146Mhz. Darn good for a little plumbing. I mounted it on my roof after coating the choke and connections with bathtub caulk. Been working fine since.

Now I have to figure out what to do for HF.

If you aren't restricted from having a small flagpole.... Build your antenna from conduit and proudly fly your flag from the flagpo.... er antenna.

You might mount a twin-lead j-pole inside a PVC mast. Hook up your feedline to the j-pole and fly the flag from the outer housing- the PVC pipe.

Read about these practices elsewhere. I live where I can have any kind of antenna I want.

I made mine out of steel conduit and "brazed" it together. Brazing deposits copper on the joints. I also put a tack of braze where the feedlines have to connect and found I could solder easily to that.

Best of luck on your antenna project..

That is correct; the 5711 is one of the 2800 series of diodes from HP.
I did build probes using the 5711s and the zero bias schottky types, and
detected no difference, using a Boonton 103D generator. Now at the very
low levels.....that could be a different story.

Bob, I guess I was "Lucky" too. I ordered a DSW-40 the last part of May got the board kit in early July and assembled it. Now it's sitting on my workbench waiting on the enclosure which keeps being postponed. I'm sure anxious to get it finished. (Don't know if it will run yet!) In May I had visions of doing some mountain topping but now I'm wondering if I'll be still waiting when snow begins piling up on my doorstep... but alas, I guess I'm "lucky."

:)

thanks to all who emailed and replied to this request any more contacts would be greatly received but could the people who gave some insight into this problem please help to design the project as I have no design skills I can only read the diagrams I am but the humble student of the mystery art (in other words I am still learning by teaching my self and reading books ,web pages and any other useful means of learning this skill) .

Yes, I have. I have designed a AM BC Regen radio kit based on Charles' Kitchin design. I have wound numerous loopsticks with various types of wire and measured their Q at 1 Mhz with an HP 4275A Multi-Frequency LCR Meter. Compared to a single conductor wire, litz wound coils of similar total wire diameter consistently yielded Q values in the neighborhood of 5 to 10 times greater.

The coils also seemed to have less stray (inter-winding?) capacitance, though I am not sure why.

Coil performance was improved enough to motivate me to have some custom litz wire made. It wasn't cheap. Two pounds cost me about $250. My best guess is that actual cost per foot is about $.03.

At higher frequencies (above 2MHz) and lower frequencies (below 100KHz) there is no advantage in using litz wire.

Hope this helps.

>If you aren't restricted from having a small flagpole.... Build your antenna
>from conduit and proudly fly your flag from the flagpo.... er antenna.

I have a homemade "free-standing" (from soffit level upwards) flagpole/antenna:

```
| 33-foot pipe with flag-rope pulley at top
| (and I do fly US and KS flags occasionally!)
\ :
\ :
\ |
-----|==| pipe-clamp as main vertical and horizontal support
| (assumes house wood is sufficient insulation, and
| I've not seen any difference when the roof is wet)
: (soffit is about 11 feet above ground)
|
+-+ |
| |-0| screw-in insulator with wire holding pipe
| | <--about 4-inch air gap here
---| |-|--------------------------------- GROUND LEVEL
| | |
| |<|----- cedar (or redwood; I forget) 4x4 post several feet deep
| | |
|
| 8 (or 10?) foot copper ground rod
:
|
```

It's fed (center conductor to vertical, shield to ground rod) at bottom
by a coax about 35 feet long which runs across the basement ceiling to
my "shack" on the other side of the house. I originally used a home-made
tuner until bought rig with built-in tuner; the antenna works quite well
on 40 meters and up. I occasionally put a few spoonfulls of copper
sulphate near the top of the ground rod, and normal roof-drip dissolves
it and lets it sink into the ground.

2234. L.O.S.A - List of Stamp Applications [000907]

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-08 16:29:47 UTC
From: cjX@hth.com
Message-ID: <39b9109b.517300@news.sverige.net>
Source record: 58009
Cross-posted to: comp.robotics.misc,comp.home.automation,sci.electronics.misc,rec.radio.amateur.homebrew

Hi,

Below is the latest index of L.O.S.A and it now contains 200+
BASIC Stamp projects. You can download the complete L.O.S.A
from the following places...

WWW:

http://www.hth.com/losa/

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially Guy
Gustavson's story (see #001) about how he saved his beloved cat Kesha
gave me the inspiration to start writing L.O.S.A. I hope Kesha still
is alive and having a great life. Now 5 years later there are 190+
applications described and I hope you will enjoy reading all (or
parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa/

1.2 Why are some links dud's ?

Since people changes their e-mail and web addresses some links may be
dud's. If you previously contributed with one (or more) of the

applications please take a quick look and check your e-mail address
and/or web-links. I'm only able to keep the list updated if I'm
informed about changes, thanks in advance.

1.3 List of contributions

Hi Jeff,

You're kidding, right? You will need an FCC license to do any broadcasting past
the confines of your building. That will be difficult. http://www.fcc.com
The equipment is the easy part.

You might want to consider setting up a "radio station" on the internet a la
Real Audio. Don't need a license for those.

Best regards,

Steve Robertson

That's amazing. I had no idea Litz wire could make so much difference.
Was this Litz wire of the homemade variety described here?

What range of inductance and Q were you measuring? That is, what were
the approximate L and Q of the inductors wound with Litz and
conventional wire? Were the coils far from self resonance?

Roy,
I remember litz wire being used for earphones during WWII. I think the
construction of the wire lends itself to rough handling without breaking and
its resistance to tangling.
I am dubious about the other merits listed, and would love to see
measurements by disinterested 3rd parties.

The wire was manufactured by WireTronic, Pine Grove, CA. It is 16/43 single layer nylon served, 36 twists per foot (I believe these are the correct specifications. The wire is at home. I am at work). You will find WireTronic at www.wiretron.com. I was very pleased with the quality of the wire they sent me.
>
> What range of inductance and Q were you measuring? That is, what were
> the approximate L and Q of the inductors wound with Litz and

For example, a 400 microH. litz wound loopstick had a Q in the neighborhood of 600 at 1MHz. Please understand that it is difficult to get stable reading on the HP meter when Q's are this high.

In contrast the enamaled magnet wire coil had a Q of about 100. I am quoting from memory. If I wanted to publish a paper I would remeasure everything. I needed a very good coil. I stopped comparing types of wire when a acceptable and reproducible coil was designed.

I did not measure self resonance. The HP meter's discrete test frequencies make this difficult. This may be done later with a different test set-up.

The coils were wound on a converted Harbor Freight 7 X 10 inch lathe. This turned out to be a very effective way to get consistent inductance values. By setting the thread pitch to 52 threads per inch the lathe produced very nice 52 turns per inch coils. The small air gap between turns helps minimize inter-winding capacitance.

I am not a expert in coil design. It was my good fortune to have access to some good test equipment and some engineers who were willing to help me understand what I was doing.

I am covinced that, between 100KHz and 2MHz, properly designed litz wire provides a great advantage over single strand wire of the same diameter.

I am after some circuits for very simple, low power transmitters to be tracked with DF equipment on 144Mhz.

I had in mind a single transistor circuit transmitting simple CW. I would use a PIC micro controller to key the morse ident.

Must run off 1.5 or 3v and be xtal controlled.

Are there any web sites with such info or suitable books ?

Stuart.

2240. Mobile amplifer -can make from parts?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-09 03:59:08 UTC
From: PAT JANKOWIAK <vaxhackery@worldnet.att.net>
Message-ID: <39B9B57B.62BC0565@worldnet.att.net>
Source record: 58015

I have one of those 'broadband' pulse amplifers usually used for scientific work. It has six 4CX250B tubes, a blower, and an N connector or two, but not much else. It looks like some kind of 'distributed amplifier' which I have seen only one or two of. Anyway, the tubes are essentially in parallel with a parasitic supperssor in each plate and grid lead. I have no power supply.

I wonder if it's possible within reason to use this as an RF deck for a mobile linear amplifier? The tubes are real rugged and I have lots of room in a 4' rack in the van.. They'd probably never wear out, with 6 of them to do the work.. I guess the main problem would be coming up with 2000VDC@750mA or so..

Anyone done anything like this, especially with respect to the power supply? A switching power supply would be cool.. i realize of course that I'd need a couple big batteries..

The others on this newsgroup are apparently not aware
(for whatever reason!) of a significant gray/black market
in low power AM and FM broadcast transmitters, antennas,
studio equipment, etc, etc.

This is a good place to start:
http://members.tripod.com/~transmitters/links.htm

But remember that they don't call it PIRATE radio for nothing!

2242. Looking for RF Concepts 2-417 Schematic

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-09 09:27:05 UTC
From: Dan K Nelson <w6dkn@qsl.net>
Message-ID: <Innu5.2421$Er2.487144@paloalto-snr1.gtei.net>
Source record: 58017

Hello All,

I have an RF Concepts 2-417 2 meter amp that lost the pre-amp function.
Would anybody happen to have a schematic and/or manual that they could copy
or scan ? Will be glad to pay for the time and trouble.

Thanks and 73,

Dan - W6DKN

2243. Re: Ramsey Electronics (I am not complaining)

Yes, that's exactly right, but you are using a
comercial amp.
I bought a Mirage amp and found they use
an extensive swr/power overload circuit to shut down the amplifier
should the swr go higher than 3-1.
I already knew this and use a 50 ohm dummy load, and my antenna
exhibits a 1.1 match.
I have also built several power amps and receive preamps,(in the distant
past) and the problem is very similar to what happens to an amp with
self oscillation or too much gain.
I just would not expect the transistor in the PA-1 to arc or short out
as fast as it does, even at a lower supply voltage, for testing.
The overload circuit should be included in the kit , just as much as
requiring a heat sink (although I am just asuming this is the problem,
they may still be using cheap or defective transistors.)
I did not have much success with the solid state
amps I built in the past, as the information in
magazines (QST articles are like rocket science to me!) and the ARRL
handbook (especially now) is very sparse on theory and faq's.
I just would not think a company as big as Ramsey E (regardless of the
"no warranty" statement) would try to promote one of their
products (PA-10) with the kit-ed version (PA-1) of this supposedly
successfull product.
.....
.....
I decided to give it one more try before throwing
the thing in the dumpster!
I added a t/r relay circuit (Ramsey) which worked great, switching
occured all the way down to 1 watt with the MFJ qrp rig in the cw mode,
I even added a keying circuit for the slow recovery ssb (I would much
prefer full-break in
for the cw) output jack on the MFJ, replacing Q1 on the Ramsey freq.
switch with a pnp instead of an npn transistor, and made the
circuit very high impedance so as to isolate it from the rf switch and
dc amp, thus switching the relay transistors indirectly instead
of grounding the relay directly from the keying
jack on the MFJ.
Now,,,,,,explain this to me, the output went to
what appeared to be 45 watts! when using the high setting of the
HTX-202! (it was not self oscillating) As usual, just as I was in
ecstasy the thing blew up!
But what was it in the extra 2 or 3 extra inches
of connecting coax (RG-174) added to the t/r relay, that caused the amp
to finally tune up?

Again, this extra reactance (or what ever) should be included in the kit, I really want to get this thing going because there is a rare tropo condition going on because of the weather.
To tell you the truth, I think the reason their kits are so incomplete is maybe they really don't know anything about this stuff at all!!

It's gone beyond the gray/black market. These items are being sold by large distributors and now, with the advent of the Low Power FM license, you'll probably start seeing more of it. You can also do a search for "pirate radio" or "lpfm" or even "low power fm" on your favorite search engine. The radio free berkley site is also a good one to look at. Their web addy escapes me, but will be found with the above search strings.

Low power radio license:
http://www.fcc.gov/mmb/prd/lpfm/

Fcc rules governing non-licensed radio can be found at:
http://www.fcc.gov/mmb/asd/
http://www.fcc.gov/mmb/asd/lowpwr.html

Additional LPFM info can be found at:
http://members.tripod.com/~transmitters/ (as was referenced earlier)
http://www.hobbybroadcasting.com/
http://www.irational.org/radio/radio_guide/

Actual transmitter kits for purchase can be found at:
http://www.northcountryradio.com/index.htm
http://www.mcmelectronics.com look in the hobbyist's corner

Here is a good start for you. Also check out the links on these pages as they will access you to more information. The links I gave aren't even the tip of the iceburg!

I wish you the best of luck, and don't be put off by the "Pirate Radio" references! Done correctly broadcasting in the FM and AM bands can be done license free LEAGALLY!

Jay

This nproject has two parts:

I'd build a 'ground-bound' power supply to work out the RF issues in the amp.

Once the RF issues are resolved, approach the design of the power supply for use in the vehicle. If you're going to use separate batteries for the amp, seriously consider 24 volts. The 24 volt filament voltage version of the 4X250 is plentiful (or were the last time I looked) and that should solve the filament voltage problem when you go to 24 volts. 24 volt alternators are available from several of the military surplus vehicle and equipment dealers

A very frightening trend that I see is that the younger generation coming up just doesn't care. They've never had the motive or opportunity to do anything remotely electronic, electronic parts retailers are fleeing like rats from a sinking ship, and this newer generation will end up contributing little or nothing, hardware-wise. If electronic parts can only be gotten mail-order, then it will be too much of a bother for anyone to get involved. Radio Shack Canada has just ditched all of their electronic components - Ingrates! They just threw it all out! The only other parts seller in my vicinity hasn't restocked in 15 years. In my opinion, these places should be classified as educational resources and be supported, otherwise an entire generation will be completely ignorant of the hardware side of things - and possibly the generation after...

TV, computer, video, radio - all on a plate, there is no
call for "necessity being the mother of invention".

Spoon-fed and utterly demanding, the younger generation
of today remain infantile. You only have to read the bleatings
and immature name-callings on this NG to appreciate this.
(In fact, some of these infantile personae have even managed to
obtain "G3" callsigns, recent days' contributions bear witness
to this). There are loadsa whingeing CBers who
want to be given a Ham Radio licence in return for no
effort on their part.

Even in the world of professional computing; today's
so-called graduates of Computer Science are unable to explain
the workings of a computer, either in hardware terms, or in
terms of assembly-language. "Who needs to know that? The compiler
does it all for you!"

Are we doomed to a generation of less-than-technicians instead of
engineers-in-the-making. E.g., poor quality technicians see the dB as a
measure
of voltage ratios. Engineers of any worth know a different definition.

But one could ague that there are more important things that can be done by
building on what already exists. No point in reinventing the wheel, or even
understanding it, if its not required. Its nice to think that one should
understand everything that went before in grate detail, but it is not really
necessary, in fact it can hold one back. Someone developing a new, highly
complex, genetic/neural net algorithmic approach to a Data, would simply be
wasting time trying to learn how an assembler works. Its simply not relevant
to the problem, there are for more difficult tasks to be concerned about.

On the contrary, to use a wheel one must have a knowledge of how it works. Example. a wheel whose axle can be moved remains fixed requires far stronger bearings than one whose axle is fixed. Gyroscopic precession is a vastly underated force. and if no one understands the wheel who will make them for the end user.

If basic principles were taught more emphatically then less high tech failures would be occuring.

We need basic skills in the new engineers,

The essence of any graduate education is being instilled with an in-depth
understanding of your field from elementals upwards, so preparing you
for employment in ANY field. As a computer "scientist" (with "science"
meaning "knowledge") you may be called upon to work in any area
from Neural Networks to operating systems, even writing the code
generation phase of a compiler.

Ok, it's different if you're a technician, when you will be trained on the
few
technological elements that are extant today - but my critique
was of the useless computer science graduate of today.

I wouldn't normally quote the whole of a posting by The Anus, but he
has raised several points which have a common theme - that of what he
maintains is an "ill-educated" "modern generation" with "inappropriate
values".

But who gave the modern generation this attitude? Who was it that
failed to pass on their "old ways"? Well, it can only have come from
the "older generation", of which The Anus is a part! It therefore
follows that he shares the responsibility for the very things he
condemns!

It would be interesting to know if The Anus had any hand in bringing up the modern generation wheich he so slightingly condemns.

I don disagree that engineers need the basic skills, but I do not accept that one need to know how things work in order to use them effectively at all. You only need to know how it behaves, in a black box sense. Consider a transistor. There is quite a lot quantum mechanics underlying its operation. However, to use transistors very effectively, one only needs to know the resulting equations. How it actually works is simply not relevant. It could be made from Swiss cheese as long as the operational equations are known. This statement has significant support in physics and mathematics. In fact, how the transistor works in a true sense is not even possible, as it is based on Q.M, and Q.M is based on postulates that are based on an inherent lack of knowledge. By and large all serious work in physics is done with no attempt whatsoever to have a "true" understanding of what's going on. For example, there are a few (see sci.physics.relativity) people who believe in the Lorentz Aether Theory (LET), instead of Special Relativity (S.R.). LET uses a physical concept of on aether to explain "why" time slows down etc and is indistinguishable from S.R experimentally. S.R. has no such physical mechanism to explain the results. However, all work of any significance in physics has only been done in S.R, not LET. It appears that for advanced work, how things work is nothing more then an annoying distraction. It simpl y complicates matters. It is true though, that some people do need the comfort of some elementary "explanation" of how things might work, even if false.

2260. Re: VR136 - Metal valve details please.

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-09 19:25:11 UTC
From: Martin Ackroyd <martin.ackroyd@virgin.net>
Message-ID: <39BA8E97.FB1810EC@virgin.net>
Source record: 58036

According a databook VR136 is a military equivalent of Mullard EF54.
It's actually an all-glass valve, in an all enveloping aluminium can.

EF54 is like a souped-up EF50 - aligned grids to reduce noise and
multiple cathode pins to enhance VHF performance.

connections are:
1 h
2 a
3 g2
4 k,g3,s
5 k,g3,s
6 g1
7 k,g3,s
8 k,g3,s
9 h

Vh = 6.3V
Ih = 300mA

Va = Vg2 = 250V
Vg1 = -1.7V
Rk = 150 ohms
Ia = 10mA
Ig2 = 1.45 mA
gm = 7.7mA/V
ra = 500kohm
Rin = 10 k ohm [at 50 MHz]

The receiver sounds very interesting an unusual item - anything using
acorn valves is a rarity. Covering this frequency range is very
unusual for a set that eveidently dates from the early/mid forties.

A picture of the set would be of great
interest. How many valves altogether does it have?

> Oscillators don't, amplifiers do"

It is always a good idea to know what's inside the 'black box', because
if one looks close enough, it may be possible to make a much simpler
solution. Case in point: An old project of mine was a PWM to analog
converter, which I thought I could use to drive motors from a RC-servo
signal. The method I thought about used a latched counter and a HF
oscillator and a D/A converter and a legion of op-amps to count up the
time of each pulse and output it in analog. Then an old friend of mine
showed me an equivalent circuit consisting of two transistors and a
capacitor. I've never felt so humbled by sheer engineering prowess...
True, one doesn't have to understand quantum mechanics to use a

microchip, but it is good to understand things on a deeper level than they are given to you on; if you have a basic concept of transistors, microchips make a helluva lot more sense.

A very simplistic argument KA. You can just about use a compiler on a pc
as a black box because it has been very debugged and there are system calls
to do most things. To use a C compiler on a small embedded chip, you will
soon get into assembler to understand why the program doesn't work as
expected. You will then get the data sheet and understand the hardware.

To properly design rf oscillators, amplifiers, filters etc, you need to
get into more physics and visualize the electric and magnetic coupling
effects between components. You need to estimate the effect of parasitic
capacitances and inductances and spurious resonances. To design class-c
rf power amplifiers, you need to calculate for the charge that is flowing
in and out the transistor base and thru the collector-base capacitance.

For low-noise design, you need to think in terms of noisy pn junctions,
noisy resistors, capacitors(!), electric/magnetic induction, skin-depth,
etc.

To successfully use an rf ic without lots of iterations, i look at the
internal circuit diagram and connect the external components with the
same know-how as i would have if i had designed the ic myself as a
discrete circuit. I reverse engineer any interesting circuits i see
so that i can get new ideas i hadn't thought of.

To design oscillators, you should have complete information about the
resonator. How many people design a cpu oscillator taking into account
the crystal esr and power dissipation?

Everything i do i understand the fundamentals, simply because you need to
know how it works to debug it. You don't need to go to quantum level, you
just need to understand the device to a basic functionality level. The
basic functionality level for the bjt transistor is charge control
behaviour and dc characteristics. For a micro-controller, its assembler
instructions, peripheral hardware functions, pin voltage/current
characteristics, machine states, etc. For a compiler, its syntax, assembler
output, and compiler directives.

IMHO, anyone that thinks an rf ic should be treated as a black box
is not someone i would take advice from.

Source record: 58040

Hi
Thanks for the great comments received from my post on the sw+ cw transceiver by Small Wonders Labs. I was just about to place an order when I ran across a web site (http://www.ohr.com/ohr100a.htm) selling a similar qrp single band cw transceiver kit called the OHR100a.

It also looks good. It has double the tuning range (75kh) and RIT is built in. The optional frequency readout kit is a display but costs quite a bit more than SW's audio kit.
Does anyone know how this rig compares with the SW+ in areas such as receiver sensitivity and selectivity , customer satisfaction etc?
Tnx
Wayne

I worked for a local engineering company that makes very technical machines.
All of my time was spent on the development of these machines. On these
machines various systems were interactive and it took a lot of experience to
understand how the basics of them workek, and interacted in theur many
varients.
In the early days, when we found a problem where, for example, a warning
light did not come on at the right time, or came on when no fault was found,
we called in the so called experts of that particular system.

Because they did not understand the basics, they could not explain what the
fault was. Many was the time, that we listened to the 'experts' explaining
that this or that should not happen, we got to the point where we never
asked the 'experts' because they could not explain the cause of the fault.
What they could tell you, was what should happen. Lot of help that was, we
already knew what should happen.

All was down to the so called expert did not know the basics of his
profession.

Hence the very old expression:-

A little knowledge is a dangerous thing.

One way to do it is by running the signal through a Class C amplifier, above the amplifier's 1dB compression point. I have heard two terms describing this mechanism; one fellow called it Varactor Division, while the other one called it Parametric Pumping. I am not sure which term is correct, but the result of this setup is subharmonics of the input frequency.

I believe this unit to be the same as the Watkins-Johnson WJ-M6H. The specs are as follows: NF=5dB TYP, pin-out is as follows: pins 1 and 5 are LO, pins 4 and 8 are RF, and for IF output, you pins 3 and 7 together. The IF output is an unbananced output, referenced to ground. You also need to tie pins 2 and 6 together. Pins 2 and 6 need to be tied to ground. For unbalanced operation of the LO and RF ports, I believe you can tie pin 5 to ground, bringing the LO into pin 1, and tying pin 4 to ground, bringing the RF into pin 8. You want +7dBm (5mW) of LO injection for this mixer. If you get below +4dBm, noise figure will suffer, while above +10dBm, and the distortion products at the IF output will climb. You might already know about this, but I will mention it anyway. Make sure that you add a diplexer after the mixer, using components with a reactance of approximately 50 Ohms. One way you can do this is by having a parallel resonant circuit, resonant at the IF output frequency, with a series L shunt C filter also resonant at the IF output frequency, with an impedance transformation to match the 50 Ohm output of the mixer to the input impedance of your radio, unless you are going into a 50 Ohm input. If you use a variable frequency oscillator at the LO input, this makes the diplexer design not too difficult, but if you intend to use a fixed crystal oscillator as an LO, you will need a bandpass filter at the IF output.
You've got a pretty good idea, using this type of mixer. They are fairly bulletproof.

I work in the group at Intel that designs the transistors/ circuits/ fab processes for the major microprocessor products (Pentium, etc.) It is amusing to note that what others take to be a "digital" device (a microprocessor) is treated in a very linear/analog approach inside the chip.

Engineers who don't understand the whole picture from semiconductor physics all the way up through product feature selection and market conditions don't last very long (if they even make it through vetting in the first place.)

I can not believe that I have actually read this. This statement is truly amazing. I suggest that this is what you wish were true. I have been an engineer (mainly analog and software) for about 20 years and I have never, absolutely never, in 12 companies, met someone as you describe here. There are 100,000's of engineers, and you are trying to suggest that they are all as wonderful as this. Your dreammmmming matey.

I my self have done extensive software development on realtime embedded
hardware in C, just as you describe here, and have never had to consider any
assemble aspects to the code at all, period. Which was quite fortunate in
fact, because I am crap at assemble, so your argument here is flawed. Most
people like to think that they have a skill that is very important and
indispensable, but the reality is that this is not so. Its not possible, in
my view, to know it all. With modern systems today, you have to delegate
tasks to those who have that specific expertise. i.e. I expect the compiler
writer to get it right. The days of the one man band are over.

In 20 years of being an engineer, I have not met one engineer who can derive
the thermal noise formula, never. As I said before, an engineer only needs
to know the equations.

As I said. You do not need to know how the resonator actually works
physically, all you need is its characteristics.

Are the type who wondered why one make of 2n3055 worked in a design and
another make of 2n3055 did not work even though both were identidally
specced.
It took someone with knowledge of the operation of the two methods of
manufacture to identify the cause.

Some basic knowledge is necessary.

Bernard

2283. WTB: link coil jack bars, sockets, LARGE

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-10 15:16:05 UTC
From: k9sqg@aol.com

Source record: 57960

Looking for some spare jack bars and sockets for the large link coils of yesteryear, the size LARGER than the BC-610 size. I need primarily the sockets, but if you have some spare pins or ceramic jack bars, I might be interested. The pins are about 1/4 inch in diameter, and the sockets have a 1/4 inch opening. Prefer new old stock.

Thanks for reading the posting.

Lorain (a manufacturer of power eqpt.) used to make a SubCycle
generator.
They put 60 Hz. in and got 20 Hz. out. It was used to generate
the ringing voltage for telephones. No rotating parts, just coils and
capacitors.

> --
> Dick GM0MNL

>>
To: Dick et al.

Oh me son! You've crept.
But your right!
I remember at a very early age being intrigued by the glowing heaters in the valves (tubes) of our 1930s HMV (His Master's Voice) straight TRF 'wireless set'. Had a big clunky band switch which included a position for 'Gramaphone' Big 4 volt heater tubes. After that I was hooked. I rebuilt that radio after W.W.II using an ex Navy power transformer and an SP41 tube out of a radar or 'Gee' set.

Other memories abound; like the time I dropped a glass 6K7, part of the first radio I ever built! (It worked, sort of, too).
Two or three weeks pocket money gone; and they were available then, 'surplus', for a few 'bob'. i.e. shillings!
Oh yes I remember too, the eerie blue fluorescence of the glass envelope of 807 driver tube (no it wasn't a 'soft tube) in the number 12 Army Cadets transmitter I operated on/around 5.1 Megacycles in the 1950s.!

Don't get the same thrill from a computer chip somehow!

Now why do I remember all this old stuff, such as what is a VR136; must be a sign of age too!

Yours Dodderingly! Terry Sanford. Torbay, Newfoundland, Canada.
A few miles from where Marconi in 1901 received the first trans. Atlantic wireless message from Cornwall in UK. .

PS. It was interesting to see that people in several parts of the world responded rapidly and cheerfully to the request for info about the VR136 by a young fellow in Australia. While I guess that we like to show what we know (or half remember!) it was a real demonstration IMHO of one the better aspects of the the 'radio hobby'. Information about a product developed for war becoming an instrument for co-operation etc.
Would that other things in this world society were handled so well. (End of sermon).

Gosh I MUST be getting old, to start moralizing like that!

Nonsense.

As I have noted before, I know many, many engineers who don't really know
the physics, but they certainly know that components from different
manufactures can behave very much different and take apropiate measures in
their designs.

> It took someone with knowledge of the operation of the two methods of
> manufacture to identify the cause.
>
> Some basic knowledge is necessary.
>
> Bernard

Yes basic knowledge is required, but true understranding of that knowledge
is not.

What I do find interesting here from these replies, is that I perceive many
are from people who think that they understand the physics themselves. If
these individuals can derive, from first principles for example, from the
shrodinger equation H|Y> = E|Y>, the basic energy level characteristics of
silicon bandgaps, then it may well be true that they do in fact understand
the true "..picture from semiconductor physics...". Otherwise, they do not
and are fooling themselvs, but I am sure these same individuals will not
deny to themselves that they still do understand sufficiently the design of
electronic products.

The bolts/nuts are a minor part of the problem. You've got to wind all the toroids in the opposite direction depending upon which hemisphere you intend to operate. Otherwise there's an additional 20 dB of loss when working DX across the equator. I'll bet you always wondered why some stations have better luck with DX than others :-)

I would not claim to understand the molecular level physics of the
transistor but I do claim to know the internal effects that contribute to
the transistor action of the device. This comes in useful when a new
engineer comes to me with a prototype with charred power devices and a
pleading look on his face. Effects like base capacitor, switching effects,
base resistance which as individual parameters seem trivial but with some
understanding of the internal operation the young engineer has a far better
understanding of why the silicon was bar-be-qued.

Bernard the old dinosaur.

Surely this could be due to any number of minor differences in the
raw materials, process method, process parameters or environmental
conditions.
The circuit designer (specified) should / MUST make allowance for these
differences in his circuit so that a range of components supplied to the
quoted spec will work acceptable in the circuit design.

Staurt,

Try this web page for starters,
http://members.aol.com/homingin/

Also, look for web pages fot amateur radio folks who launch ballons and track them. I remember this summer hitting a few pages that had simple, CW 2m tracking transmitters. I pulled a few of the schematics off the web for some local DF fun. If you don't find anything, drop me an e-mail and I'll send you a copy of the schematics I have accumulated for little tracking transmitters.

good luck!
Tim Cadigan, WC1F

Ahh yes, understanding of what it does, but not how it does it. For the
example as you indicate here, the base emitter capacitance is proportional
to emitter current. This fact, in my view, must be known in order to design
transistor circuits effectively, so I agree with you here I think. However,
the understanding of this capacitance in any depth, really requires
understanding of the Einstein diffusion equation and all the rest of that
physics good stuff, which I think is a tall order for most EEs and simply
not required.

> 5-15 mile reach)?

Back on 20 Jan 00 the FCC implemented the Low Power FM (LPFM) broadcasting service. It consists of two classes of stations, having maximum power levels of 1000 and 100 watts, with the possibility of a micropower class (0-10 watts) being added later. The service is intended to be exclusively non-commercial. Current broadcast licensees or parties with commercial interests (e.g., newspapers or cable) are not eligible. Moreover, licenses must reside within the local area.

In April the Commission opened a five day window to accept applications (using FCC Form 318) for spectrum slots in Alaska, California, DC, Georgia, Indiana, Louisiana, Maine, Mariana Islands, Maryland, Oklahoma, Rhode Island and Utah. Four additional filing windows were to be opened at three month intervals.

For more information see the FCC's LPFM website at URL <http://www.fcc.gov/lpfm> or call the hotline at 1-888-CALL-FCC. You might also use the site's search engine to look for the keyword micropower, in case there have been recent developments.

You should probably expect that the equipment to be used will have to be "type approved," which tends to move this subject outside the realm of homebrew.

Paying for a compiler thats done right is just a matter of money. Why not
pay more to get someone else to do your programming *for* you? In fact, just
pay enough people to do your job. Engineering is about generating higher value
output than what was put in as expenses. If you need to generate low-cost/low-
volume widgets, you need to use cheaper tools and do more work yourself, and
generate elegant solutions from uncommonly known characteristics of the raw
materials.

Who said derive the formula? You just need to know the basic functionality
level eg: that 1/f noise is generated by pn junctions etc, and that certain formulae
can be invalidated by effects in your circuit that you would only know by having
a clue where the formula came from and what it represents.

Yes but what if i wanted to feed pulsed rf power thru a crystal filter, and there was no info on the data-sheet for that? Having a physical insight into the device makes such design problems easy. If it was simply treated as a black-box with attitude, you'd have to do lots of exhaustive destructive testing to find its limits.

IC data sheets often show internal circuit diagrams that explains without words, a lot about the external characteristics of the device. With enough data, anything can be treated as a black box. However, the amount of printed pages would be impractical in many cases, so physical insight gets around that problem. To reverse engineer something, you need to 'get like the originator'.

Dichloromethane works very well as a polystyrene (and many other plastics) solvent. AKA methylene chloride or DCM. Available at any chemical supplier, or most plastics suppliers (used for solvent welding acrylic, polycarbonate, and PVC). Use with decent ventilation, as the fumes are somewhat nasty.

You actual example here only proves my point. I am saying that you do not need to understand, only know the results. If you can not derive the results, you don not really understand it, what I am claiming is not actually necessary. The cause of 1/f noise, is in general, is not known. There are various mechanisms, but I have never seen any definitive statements on the matter, despite much searching. However, I did discover experimentally about 20 years ago that 1/f noise could be reduced significantly in some instances by operating at a Vce of ~0.5V. I have not seen much motioned on this effect, nevertheless I have been able to make nice use of this information without really knowing the detailed principles, other then things like surface leakage effects, if relevant at all. Therefore your claim on not knowing where 1/f noise comes from is a limitation, is clearly false. I am the contradiction to that assertion.

As an analog I.C designer I can tell you with good authority, that the
internal circuit diagrams shown to the punters most often bare no relevance
at all to the actual circuit used. In fact sometimes they are deliberately
incorrect to mislead the competition. Most circuits are considered trade
secrets, even if obvious or elsewhere published. It is held by I.C. makers
that users should stick to the data sheets only. If you make assumptions on
how you think the circuit is designed, sooner or later, you will make a
right arse of yourself.

And i said that you should know the principles from the 'basic functionality
level', which is higher than the quantum mechanical level. Therefore, i can
derive any formulae for a circuit from the basic transistor characteristics,
not needing to know the quantum level effects.

By having insight into the transistor operation, you guessed that low C-E
voltage on a bjt will reduce surface leakage currents (which shows up as
random 'steps' of bias current). Therefore, you are agreeing with what i
say.

I know that not everything is shown, but what is shown in most cases is not an outright lie (which i've found), and so is useful. I don't care if the occaisonal diagram is wrong, because i'll find the problem in my prototype. Having an internal circuit means most prototypes work as expected, and when they don't, its due to some other reason such as a stupid mistake/oversight. If an ic behaves completely differently to what the internal diagram indicates, and the data isn't clear, i won't buy any more of them.

rec.radio.swap,rec.radio.amateur,rec.radio.amateur.swap,rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I have 5 of the type M68729 class C (i.e. FM) 30 Watts out average, 40 Watts max. These will replace older M57774 module just fine. The input drive is 300 mW for 30 watts out. I am asking $50.00 including shipping to conus for each of them them. RF parts wants around $70.00 for the same.
I will sell them all for $200, this is the equivalent of getting one for free.

These are brand new never been used and still have the one inch leads on them. I have 4 of them in a sealed rack and one loose.

Thank You,

Bryan Fields, KB9MCI

So we agree then. You do not need to really understand things in order to be
effective. Given some base operations, i.e. equations, that we cannot
derive, we can still make very usefull contributions, as I first claimed

No. I discovered it completely by accident by twiddling pots, I was still a
student at the time (20 I think). I was not trying to reduce noise at all. I

had no idea at all about any possible connection to surface leakage currents and noise. I tried looking up the effect in books, but found no reference to this effect at all, at that time.

GC makes a product called Print Coat Solvent. It's a mixture of Acetone, Toluene (SP?), and maybe someone other things. We used to use it to remove flux from PC boards after soldering. Available at electronic supply stores like Gateway Electronics. (Q Dope is still available too)
www.gatewayelex.com

It melts Styrofoam pretty good. Another tech "borrowed" some from my bench at work once by pouring it into a styro cup. Well it wound up all over the floor. PS Gasoline will do the same thing, and make the cup into Napalm....

1,1,1 Trichloroethane works well, and is safer than Benzene.
1,1.1 Trichlorethylene(a bit easier to find, should work as well).
I suspect that Perchlorethylene(dry cleaning fluid) will work too.

Which needs to be treated with care as it too, is a carceogenic.
When possible we used to use perchloro-ethylene, but man, does warm, or hot
trichlor make a great degreaser. <:-))

I compared the final temperature in the ferrite surface of two transformers wound with the same number of turns and under the same load in a 100KHz switched mode power supply.
In one transformer I used 4#27 side by side, one layer and all the other windings were maintained.
The other transformer used 3 litz wire 25#41 side by side, one layer, replacing the 4#27. This transformer presented an increase of surface temperature 6.7% lower than the first one.
The litz (25#41) had nothing special, it seems the #41 strands were simply jointed and twisted with something like a drill.

I'd like to know if the litz done by NEEWC presents anything different from twisting single wires making a basic litz and after, twisting the basic litz doing a cable (bundle).

Did any one of you make a comparison between a twisted litz wire and a "specially" twisted litz wire?

I see them in many books. Arrl handbook, ant handbook both should have
them, also Bill Orr's books have them. But nothing too complex. Just two
dipoles crossed and fed with a phasing line to the 2nd dipole. Usually
90 degrees out of phase. So you would use a 1/4 wl phasing line between
the two in that case. MK

I read years ago a radio hobby using a transmitter to send VLF (about 10kc) radio waves underground (not surface) for secret communications. This wasn't military or anything. Think the article was in Popular Radio or Popular Electronics. The receiver was a tuned circuit connected to a pipe segment buried underground. Problem is I don't recall the transmitter antenna design. Do any of you recall ever seeing that article, or another about the hobby, where I can get design specs for the transmitter and antenna? Rob Mockan.

Yes. Check out this link below. The different types of Litz wire construction are show in the links. What you will see is that some of the larger size Litz wire cables use a rope core around which the basic Litz wire bundles are wound. This is done to get a better current distribution in the wire bundles.

<snip>

And I shudder to think what it might do to polystyrene-bearing
capacitors, or other components that have vulnerable plastics as part of
their makeup.

That's to say nothing of such a mixture being wildly flammable, a
source of toxic fumes, and a possible source of residue on the board
itself.

Thanks, I'll pass. There has to be a better way to remove flux.

From: mehmeto@my-deja.com
Message-ID: <8pkurovar1@nnrp1.deja.com>
Source record: 57903

Hi All,
I want to develop a full duplex microwave radio. This one will be a bit complicated and includes FEC. The RF parts are completed (Its not a spread spectrum device). My problem is the IF parts. In order to apply FEC to the received signal I need to obtain the data and clock seperately. So, I need a QPSK demodulator that extracts the I/Q and the Clock of the received data.(A Clock recovery or timing synchro. circuit.)Does anybody know how to build such a circuit. A complete module could also be useful. (Note: The clock extraction should not done by processing preambles. I prefer to handle continous QPSK streams).
Thanks

If you just want a digital output at 1/2 frequency
than put the sine wave into a comparator, then
into a flip-flop. If you want a sine wave at
1/2 frequency, then use a phase lock loop with
your sine wave as the reference.

The best thing for you to do is get on "http:www.yahoo.com",
or some other search engine, and do a search on "QPSK".
I did a search on "Yahoo" and came up with over 5,000 web
page matches. A quick browse through them showed that there
are at least 100-200 matches that are directly related to
what you want. Lots of tutorials, papers, products, etc..

Uh, yeah, there is. We generally use hot water. Yep, that's right,
water. Solder is available these days with water soluable flux. It's
really great stuff! It's so nice to have nice clean boards with no
scrubbing, etc. just run 'em under hot water and blow dry!

No, no, no, you guys don't know a thing about sub harmonics. If you'd
spent any time in the Navy, on one of those boats that sinks on
purpose, you'd know about "sub" harmonics...

Hy guys,
I'd like to build a dish for the 2M (144Mhz) band, and i need some help
for 2 or 3 things:
How can i build the feed ?
Did you think i will be able to do some EME with a 4M dish ?
What is the Focal that i have to use for this size of dish ?

How it will works for the 70cm (430Mhz) ?
And what focal i will need for this band ?

Thanks for your help, 73

I know you didn't ask about the kit approach...
But:
http://www.aade.com/lcmeter.htm
offers a Very Good lc meter in kit form.
I have the earlier version of this and I am very pleased with it.

I think I've seem 'em in recent ARRL Handbooks.

There's a really nice one sold in kit form by AADE (Almost All Digital Electronics). Check his web site. I know you want to roll your own, but he publishes the schematic and theory of operation so you could use that. He will sell you the programmed microprocessor if you want to buy that and do the rest on your own.

I built his kit. It's a really nice, accurate and wide range L/C meter. I like the fact that it will measure down to the very small values.

No way. The gain of the dish is going to be less than 10dbd

> What is the Focal that i have to use for this size of dish ?

Depends on the geometry of the dish. You have to calculate it from the diameter and depth of the dish,

> How it will works for the 70cm (430Mhz) ?

The gain will be around 13dbd.

> And what focal I will need for this band ?

See above.

There is no way you will work EME with this setup unless your licence lets you run around 10Kw output.

A stack of 16 times 16 element yagis and you may be in with a chance.

A 4M dish is WAY too small to be an effective surface for 2M- a bit
marginal for 70cM.
Focal point is part of the dish design and does not change with frequency.
You would normally select a focal length/diameter ratio that can be
suitably illuminated with readily available feeds (0.35->0.5 are typical).

A few of the big dish guys (7M and up) are using their dishes on 70cM, but
yagi arrays are the norm.

Popular Electronics had a nice "reactance measuring system" in the early '80s. The reason that I mention it here is that their idea, implemented with discrete CMOS would be easy to implement with a BasicStamp II or a BX24.

OTOH, Jameco sells two kits for under $10 which use the display of your DVM.

> Andrew
> KG4JBM/AG

Hey Andrew. I built that kit recently and have made plenty of contacts with it so far. I would check carefully for cold solder joints. Next, recheck that you didnt mix up some of the resistors and inductors. There were a few inductors that had nearly the same color code as resistors, and I had to check them with an ohmmeter to determine which was which. The non-inductive tool must have been packaged arbitrarily as there is no alignment necessary after building. Please note that the build instructions stress frequently that one double check the placement of the transistors. There may have been a history of problems with that. If you dont have any luck, dont pitch it out. I would be willing to take a look at it for a lot less than Ramsey.

Dan

See if you can get your hands on a copy of the Sept. 2000 QST magazine. There is an excellent project article in there written by Charles Kitchin. This is a simple radio that really does work. It wouldn't cost much to put it together and your students will not be disappointed with the results.

All of Mr. Kitchin's regenerative radios work well. If you would like to tackle a higher performance design, check out his project at www.chelmsford.com/bars/regenproj.htm or check out his article the Nov/Dec 1998 issue of QEX.

Almost all of the parts he uses in his projects are inexpensive and easy to get except for the variable capacitors. If you would contact me privately at kizerian@ced.utah.edu I can help you with a very inexpensive souce for variable capacitors.

Good luck

> Is this reasoning flawed??

The flaw in the reasoning is that the inductance of the 24 volt windings is much too small for 240 volts. The magnetizing current (current with the secondary open) will be much too high. There's of course also the potential problem of the insulation not being adequate, but the transformer's likely to cook or blow a fuse before you get a chance to find out about the insulation.

Personally, I'd not use a regenerative system.... While they use few components and can be very sensitive, they appear to require constant finicky adjustment to get the best performance. And, they are susceptible to front end overload.

==========

Your original message implied an intention to be able to receive AM signals. For that purpose, a fairly simple and cheap converter can be built to convert the signal down to 1 MHz and then use a regular broadcast radio to finish the project.

The converter would be a crystal oscillator and a mixer.

==========

Building a radio to work with both AM and SSB is a more complex issue, since they need different types of detectors and AGC circuits to get best performance.

Certainly not impossible, but a more complicated undertaking.

==========

If you want primarily SSB and CW then a direct conversion design works very nicely and is also fairly low cost.

You can listen to AM with direct conversion, but the tuning has to be precise.

==========

So, all in all, I think a first question to ask yourself is what type of signals do you want to receive, (AM) or (SSB, CW) or all three.

Once you know that, then you can explore choices but that is the first thing you need to settle on.

> out there that'd I'd love to try.

Dan,

Yes, you need something in the middle. Try and find a copy of
QST magazine for September 2000. There is a good article on
a "modern" regenerative receiver in it.

Also check out http://www.fix.net/~jparker/norcal/regen/regenstuff.htm
for lots of links to regenerative receivers.

Regens are a lot easier to build than superhets, and plenty sensitive
for shortwave listening. Just build it physically strong (rigid),
with a metal front panel.

Good luck!

John, K6QQ, licensed 50 years this month.

2353. Re: Homebrew shortwave radio projects

The crystal set seems like its a little simplistic for an advanced electronics class, and the completely homebrew receiver might be a bit ambitious.

I second Mr. Garrison's suggestion about the Ten-Tec kits. Last month I built the model 1254 receiver (synthisized, microprocessor controlled dual conversion 100KHz to 30MHz coverage). $ 195.
http://www.tentec.com/tk1254.htm

While you might argue that its "just a kit" and not as challenging as building something from scratch, its quite a clever design and there is much to be learned from studying the schematics. The construction and testing/calibration are done in stages by logical blocks of circuitry. At each stage the manual explains the subcircuit and how it works with the complete receiver circuit.

Furthermore, since it is microprocessor controlled (for tuning the LO, displaying the tuned frequency, storing favorite channels in 10 memory cells, etc.) it is a very nice example of a digitally controlled analog circuit.

After I was done building the receiver, it was very easy to calibrate it to WWV. I just threw a random length of wire out the window (literally!) for an antenna and I heard every continent (except Africa and Antarctica) the first evening without really trying.

The kit is not simple, the 25 hour estimate for construction time is not too far off if you are moderately careful. If the 1254 doesn't fit what you are looking for, Ten-Tec has several other receivers. The 1254 is really a joy to use, but then my only other SWL receiver was just a glorified AC-DC, Hot-chassis, 5-tube AM receiver with a few extra Ls and Cs switched in(!)

From: Kevin White <kevinwhite@NOSPAMdsldesigns.net>
Message-ID: <8ppggl$g4c3@Radiant.dsldesigns.com>
Source record: 57857

Roy,

Why should the current be too high?

The inductance will be about 1/100 of the primary inductance but we are running it off 1/10 of the voltage, (10 in series off 240v) so the magnetizing current will be ten times that of the primary at 1/10 of the the voltage - this gives the same power.

The main flaw in the usage of the transformer in this way is that as you go up the chain of the series connected 240v windings the voltage between the primary and secondary increases up to 2,400 volts for the top one. This would breakdown the insulation unless you beefed it up.

cheers

kevin white

Hi Dan

The first radio is a relatively simple circuit, but extra care in craftsmanship can make it a very nice project. With a healthy antenna, you can expect to pick up strong signals from around the world.

But outside of craftsmanship, the "gee whiz" factor on this radio is going to be based mostly on the fact it works with so few parts, and only the electricity it pulls from the air.

I suspect your teacher would be proud to build a radio like the second one. I saw it a few weeks ago when Gary posted a link to his site on RRS. Duplicating it is liable to take time, and require a variety of skills, and I suspect more expense than you're thinking. All those little parts that don't seem expensive add up unless you've got a well stocked "junk box".

But if you are willing to commit the time, have the patience, and can find the budget to build something this ambitious, I'd go for it, because I think you'd enjoy the radio, and be justifiably proud of it for a long time. It's the nicest homebrew radio I've ever seen, and you can learn a lot from a project like this because he's done a nice job of documenting his work.

Kits do make projects like this easier. PC boards are already etched and drilled. You don't need to hunt down individual parts. Someone has taken the time to figure out a logical order to put it together, and you know the parts should all fit in the space that's allowed for them.

The down side to kits is you're not liable to learn quite as much in the process, someone else has done most of the thinking for you. Some kits tell you more than others about how the circuit works.

Whatever you decide, good luck.

Mark

I'm sorry. As I often do, I read the posting too hastily, and thought
the poster was intending to run a single 24 volt winding at 240 volts.
It was clearly written; the mistake was entirely my fault. Please cancel
last transmission, and thanks for the correction.

He is connecting the 24 volt primary windings in series (I hope) for a total
of 10 windings on a 240 volt ac supply. The secondaries are also connected
in series too for a total output voltage of 2400 volts. Since the load side
(secondary) are in series the primary current will be the same on each of
the primary windings so the voltage will divide up evenly on the 10
transformers just fine.

This is done all the time with machine control transformers where the
primary voltage is either 240 volts, or 480 volts. In the case of the 240
volt primary the 2 primary windings are connected in parallel, and for 480
volts they are connected in series.

First off, excuse the cross posting. Looking back at both of your (rec.radio.shortwave and rec.radio.amateur.homebrew) archives, neither group seems more or less appropriate for the subject.

I've always been fascinated by radio, considering that I know a couple hams and have listened to them discuss their adventures in radio. I have seriously purchased buying a shortwave radio as an entry into the world of radio.

I'm now looking for an independant project for my highschool's advanced electronics class. I'm good with a soldering iron, and have a good understanding of semiconductors, ohm's law, and other principles. Between my science classes and electronics classes, I have a basic understanding of propogation of electromagnetic waves as well as how signals are broadcasted using modulated electromagnetic waves.

It seems to me that a great connection of electronics and radio would be to build a shortwave radio receiver. I've looked around, and found a couple of resourceful pages:

http://www.antiqueradio.org/econmain.htm
http://members.aol.com/gapershi/radio/radio.htm

The first radio described is relatively basic, with only one solid state component. I don't know what stations I can expect to get with that radio and a good length antenna. I've set my absolute minimum expectations as being able to get Voice of America and BBC/London. My physical location is in CT, USA. For those of you who don't know where that is, the closest metropolitan areas to me are Boston and New York City.

The second radio would give me more than the quality I need. The downsides are that it contains several expensive integrated circuts, and the total cost of making it would be around $100USD, although that's just a guess from looking at a couple of the parts list.

I'm considering the second radio, but money is tight and that's a big investment. So my question is, what would you people recommend for someone in my shoes? I'm sure there are some middle-of-the-road projects out there that'd I'd love to try.

Thank you very much for the input,
-Dan Papasian

2362. Microsrtrip Transmission Lines

Source record: 57942

I found an application note on the Rogers Corporation's web site for calculating the impedance and effective Er of a microstrip transmission line. The values in the collection of tables, for their various Duriod laminate products, matches the values I calculate using the application note's equations. Does anyone have any experience with the equations in the application note as far as how well do they match real world results/values?

The application note is found at:

http://www.rogers-corp.com/mwu/litintbl.htm

The application note is the "RT3.1.2" and the data tables are "Tables" right next to it.

bugg at strangled dot net is a valid email address, but I get enough
unsolicited email as it is. So I threw in the words NO SPAM in there,
figuring that anyone would remove it if they wanted to reply.

I already have setup my domain with rbl to block spammers, but it isn't
terribly inefficent. Should I have enough confidence to place my email
address in plain text?

Anyhow, thank you for the recommendation. I just checked my local
library, and they don't have it, but I'll probably end up purchasing it
before the end of the week.

-Dan

David: I guess you are NOT the fellow who; back around then was reported as receiving the 200 Kcs. BBC Light Programme, filtering out all the AM modulation, by using limiter stages, mixing it with a local VFO variable oscillator to produce a drive signal for his amateur band TX. and then by keying one of the stages (I think it was the 200 kcs.) produced a 'chirp less' input to his final? In other words he keyed the 200 kcs. signal, whch of course was held to a high degree of frequency precision!
I think there was an article in the 'Short Wave Mag' of the time or something?

2367. Ramsey QRP-40 kit. Built, but don't work

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-13 00:06:18 UTC
From: cathexis@erols.com
Message-ID: <39bebda2.252729841@news.erols.com>
Source record: 57923

Greetings,

Well you might be thinking, " That's what you get for buying Ramsey."

Picked up a 40M QRP kit at a recent hamfest. My 1st kit. Completed it today
but it doesn't work. Specifically, no signals are coming out that I can detect.
Crystal is supposed to be 7.040. I really have checked and double checked
for correct components, correctly aligned (when relevant), can't spot any
shorts or obvious defects.

I'm taking this problem here because I don't want to pay 35.00+ S&H
to have Ramsey look at a 27.95 kit. Two things come to mind: First I was very
frustrated with my slow-as-syrup 40W iron and did most of the work with a 100W
gun. Did I fry my project? Secondly, one part was "wrong"; called " L1, the
sheilded 'can' inductor marked 42EB". Problem with this was instead of the
stated 2 mount tabs and two pins to solder, it had three pins. A call to "Scott"
at the factory told me it was okay to just clip the third pin. This component is
part of the VXO. The 1st test of the unit (in mid-build) is to try and key-up
the VXO. This was what failed. I went ahead and finished the build, though I
figured it was kinda hopeless.

What I haven't done is the "Verifying Transmitter RF Output" as yet.
Power supply is an old Novatec AC phone adaptor. Plug in the wall kind. Tried
tapping the power jack plug on the connectors on the board and did get an
audible clicking on my reciever, a RS DX-392. Also tried skipping up and down
through 40M to check if it was way off freq. Oddly, the kit came with one of
those non-static tools for adjusting var. caps, etc. And that same 42EB was the
only piece that seemed capable of adjustment in this way. Tried fidling with
same, no difference.

I know this is long and you're not here in person, but I would very much
appreciate any helpful ideas. As my first project I'd like it to work, but I'm
not going to do war with Ramsey when I've more positive things to do. I'd just
write them off if needed. Live and learn. I've got a multimeter, but no other
fancy tools. No other transmitter. Just the one reciever as mentioned.

On a more positive note: KG4JBM (formally Total Newbie) is now
KG4JBM/AG ! Passed my Elems. 1 & 3 last saturday. Nu-morse really made
a huge diff. I blew the RX. callsign and one "BT"; otherwise perfect copy.

Hope you can help,

Andrew
KG4JBM/AG

You don't need to know to quantum level, but you should know what assumptions
the formula relies upon, which means having an idea of how it was derived
(just from having read thru a textbook years ago, for example).

Thanks. I'll look through the back issues. I've been trying to recall
anything about the title of the article and I think it was "Underground
Pirate Radio". Thanks again. R. Mockan.

> gun. Did I fry my project?

I'd say that's a possibility. First, 100 W is way too much heat for installing solid state devices on a PC board - so is 40 W. 15 to 20 W is more realistic. Secondly, you never want to use a soldering gun around solid state stuff. There's current flowing through the tip and when you make contact with the components it's possible to get some current through the part and destroy it.

The best soldering device to use is a temperature controlled iron or station set to about 700 deg F maximum (600 deg for most small parts). Otherwise, use a 15 to 20 watt iron with a grounded tip.

2371. Transformer "reverse" effeciency

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-13 02:12:46 UTC
From: Noel Willis <AccessIT@Bigpond.net.au>

Hi to all
If using a toroidal transformer that say has a 240V primary and 24V secondary @ 300VA the secondary is rated at about 12.6 amps. Now if I turn this transformer around and run 24V AC 60Hz Sine wave what will the primary and secondary currents be?
The idea is that I could use the transformer as an invertor so as to provide 240V from a 24V AC source, but will the new primary (24V) draw 12.6 Amps at full load and the secondary supply 300VA - now I know there are losses in the transformer so what efficiency would I allow (not it is a toroidal). The reasoning is that 24V @ 12.6A = 302VA so there must be more than 300VA going in to the system at the primary - but nobody quotes it.
I suppose in simple terms to get 300VA out of a transformer (secondary winding) how many VA go in the primary? Can I use this same ratio in reverse? Does the layering of the winding reduce the efficiency - secondary being over primary?

Thanks for any ideas
Cheers
Noel Willis VK4KNW

But W5UN has 30 dB gain in his array. I have worked him on two-way SSB with 4X19 el on my end with 1.5KW. I have also worked him and K5GW on CW with the back half of a Cushcraft 32-19 Yagi on my end. I have worked several of the big guns: KB8RQ, SM5FRH, K5GW, F3VS, etc. with a single 17 el on my horizon.

That said, IMHO you aren't "working" EME unless you can hear your own echos. For that you need ~20 dBi min and 1+KW. My 4X19 was just barely enough for this. (I'm working on bigger)

To my knowledge, the only successful 2m EME worked with a dish, other than by KP4EME (300 meter) or WA6LET (45 meter), was by WA7BBM--now W7BBM, who has a homebrew 12 meter dish.

My friend W7GBI does okay on 432 MHz with an 8 meter dish. If you want to use a 4 meter dish, you better go to 1296 MHz and figure out how to generate some power.

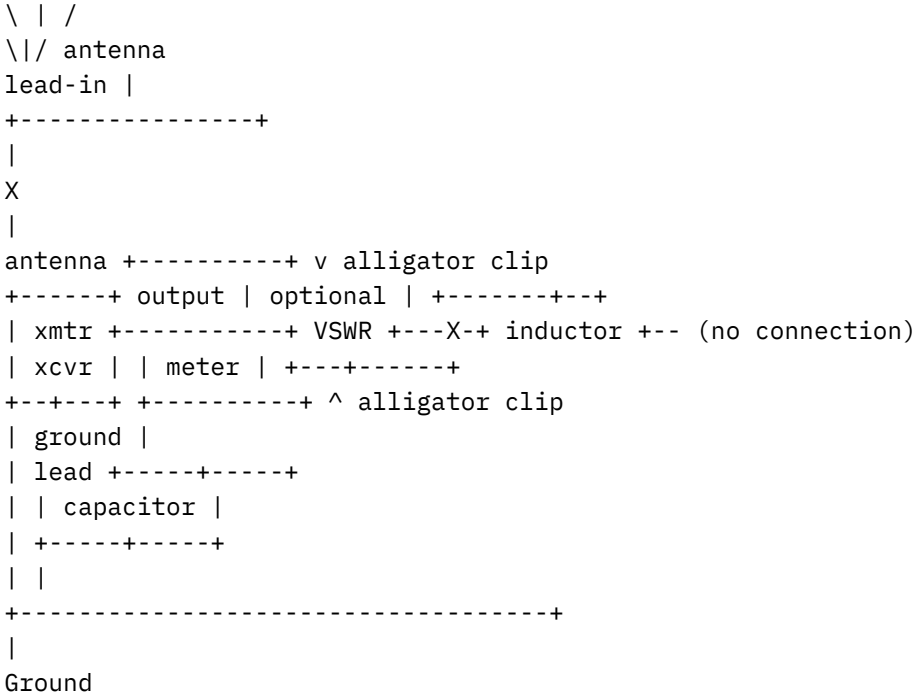
Tuners are trivial to build, as long as you don't expect them to look
like commercial Collins equipment. Although the following (which I wrote
long ago for a similar request) was for nominal 100-watt rigs, everything
is scalable.

With reasonable power (such as 100 watts), it takes a minimum of parts
(a variable capacitor which you can liberate from practically any
broadcast band receiver), two alligator clips, whatever connectors you
choose to use between your radio and the tuner and between the tuner and
the antenna, and a little bit of wire from which you can wind an
inductor [a coil] on practically anything (such as a toilet paper tube)
and use for other connections. Connect as follows: _____



Move positions of both alligator clips and adjust capacitance (yes,
there are THREE interacting adjustments!) until VSWR is lowest or until
xmtr's output meter shows maximum. From my own personal experience,
the capacitor's alligator clip will usually be about half way between
the antenna's alligator clip and the end of the inductor which connects
to the VSWR meter. As one moves to the next higher band, the positions

of both alligator clips move about half way towards the xmtr. Do initial tuneup when each band is dead (so your carrier won't bother anyone) and then record positions of alligator clips and capacitor knob for future reference.

I even have one of these in my pick-up truck, with just a slight modification: small capacitors mounted on the ends of the inductor wired at each X in the above sketch. For perfect matching, you need to be able to adjust the inductance ANYWHERE around every turn, but that's hard to do in the constricted space of the cab, so I use the eXtra capacitors to "subtract out" a little inductance in either or both of the two "windings" (between the input and the first alligator clip and between the first and second alligator clips). Overkill, perhaps, and probably looks like an early version of the Starship Enterprise's FTL engine (and no one likes to ride with me!), but it works.

The short answer is the efficiency should be about the same in either direction. Most of the losses are I squared R in the wires, on both the primary and the secondary. There is some additional loss due to core heating, but that should be very small in an air cooled transformer design.

The only difference you may see is a very small increase in current on the 24 volt side when driving it, compared to the output current when the 240 volt side is driven. The difference is the magnetizing current required to establish the flux in the core. In a good transformer design the magnetizing current should be only a percent or so of the full load current. Some cheap transformers have much higher magnetizing current, so watch out.

As far as which winding, primary or secondary, is wound on top of the other affects the coefficient of coupling between the two windings. Again in a good transformer design it does not make much difference at 50 to 60 Hz.

In the early days of ham moonbounce, you pretty much needed to be able
to hear your own reflection because there were so few capable of moonbounce
that you were your own best "other end".

In those days, you did need all that fancy equipment, and high power,
and big antennas because the equipment wasn't as good, and people were
pushing the limit.

But as it became more common, it became possible for some to have lesser equipment, since the big guns had superb equipment. It probably didn't hurt that with time low-noise reception moved from finicky and really expensive, to where low noise became common and relatively inexpensive.

After Sam Harris moved to Arecibo, he was able to arrange the use of the Big Antenna for moonbounce on one or two occasions. It would have been 1964 or 65. I remember reading a description, where someone tuned up and down the range at Arecibo, and he said it sounded like twenty meters. Of course, the big antenna and transmitter made it possible for people with quite limited equipment to do moonbounce.

Ray, I think his call was VK3ATN, did moonbounce with the power limit allowed in Australia, which I think was 150 watts at the time. Of course, he was using Big Rhombics to compensate, and he had the space.

Someone with limited equipment isn't going to be able to contact others with limited equipment, and who they can have contacts with will be limited, but there is a lot more possibility now than forty years ago.

There was an article on the subject of moonbounce with limited equipment a few years back in QST.

Even circa 1972, people were getting by with relatively small antennas. A local, VE2DFO, was doing pretty good with what couldn't have been that big an antenna. I forget exactly what he was using, but I know I considered the possibility of moonbounce at the time.

Probably more is needed than the original poster is asking about, but less than one would expect.

I can't remember if you've done soldering already. If you were having problems using a 40W iron, it makes me wonder if you were doing it right. The first thing I ever built, it never worked, and of course, I didn't have the skill to figure out why, or to really understand the circuit. I tossed it at some point, I wish I had kept it, but my rememberance is that it was horrible soldering. I didn't know at the time what a proper joint should look like, so it was only when I did get good at soldering that I could realize the bad soldering.

I hope you tinned the tip of the iron the first time you plugged it in. I didn't that first time, and I can picture the solder heating up and rolling off the tip without leaving me with any control.

With what I know now, I would suggest someone just taking parts that they can buy real cheap, or that they've scrounged up, and practice soldering without trying to build something. Just use it as a throwaway, to practice soldering. This saves the good parts. I'd also find a junk circuit board with parts attached, and try soldering some components to them, and take some parts off the board, and try soldering them back on. You'll be able to compare your solder joints with those existing on the board, and immediately see the difference.

Hearing a "click" in a receiver when you connect power to something means very little. Everything will do that.

You connected the polarity right? And measured the voltage with the power supply attached to the transmitter? If you can measure current, be careful because you could damage the meter, do so. This will give you an idea if the unit is drawing too much current (in which case there's probably a short, or a shorted component), or not drawing any current (in which case, something is not making proper connection).

One can wonder if there were three leads on the coil, and you were told to cut one lead off, if you got the right one? The guy on the phone might not have been clear. Perhaps the remaining pins are not the actual coil, or you now have only part of the coil in circuit, because the third lead is a tap.

I don't know the circuit. If the coil is in the collector of the transistor (assuming it's a bipolar), if there's no continuity between

the pins, you won't have oscillation. Likewise, if it's now not resonant, that might be a problem depending on the type of oscillator. Measure the voltage on the collector to verify that there is power getting to the oscillator, and while you're at it, make sure there is voltage on the base.

The important thing is to get the oscillator working, at which point the rest will be relatively easy. But if you don't have a signal from the oscillator, you won't have anything to amplify.

If the coil is in series with the crystal, as the element to make the crystal slightly variable, again make sure there is continuity between the pins. You might try shorting the coil, to see if it's affecting the crystal.

Make sure the capacitors around the oscillator are of the correct value. The small values, in the pF range, will be providing feedback for the oscillator, and if they get mixed up, the oscillator may not oscillate.

What to check depends a lot on the type of oscillator.

It did make sense for the instructions to tell you to get the oscillator working first. I can picture scenarios where the oscillator is fine, but the following stage is putting it out of oscillation.

A good single yagi is much better than a 4 m (diameter) paraboloid on
2 m.

I remember, back in the Fifties, I used a pentode with a 100kHz tuned pot core in the anode circuit, with a feedback winding driving a shunt ring modulator in the grid circuit. When I fed the input with the 200kHz BBC AM signal from Daventry (I was located in Rugby eight miles away from memory) I got a solid 100kHz output (with very little AM). I used this as a 100kHz secondary frequency standard.

I did not try any other division ratios (1/3, 1/4 etc) but it did work first go without adjustment. I think the configuration was referred to at the time as a "regenerative frequency divider". Hardly passive though!

Snip.

TO .Bill K7NOM

Bill. I know exactly what you mean; we used them for years in our magneto telephone exchanges right up to the 1960s. There were probably thousands used throughout North America. Black with transformers and capacitors mounted on a chassis (probably about 10 or 12 inches by 8 inches, say?) No moving parts, looked all the world like a power supply right? Absolutely reliable even in the face of weird and varying rural power ! I can't remember one ever burning out although I believe we did have one capacitor 'go' once. Saved the magneto position operator's wrist cranking out those' two longs and a short' etc on those multiparty lines! Followed by a personal message such as "Oh hello Mary. Yes Bill called and says he will be back tonight on the boat from .....". Great service those small exchanges gave, more like personal messaging than just telephone. Of course they knew all your business too!
Never knew how 'sub cycles' worked they were so reliable!

So would I allow plus 10% or ?? If it is rated at 24V @ 12.6A if I drive it
in reverse will it take 24V at 14A? Will it then put out 240V at 1.25A
(300VA)?
Since the VA rating is on the secondary can I assume it will be the same in
reverse - you will get 300VA out of it just more VA going into the
secondary?
Should I work of the reactance that the secondary must have at 60Hz for 24V
@ 12.6A and then use that to work out the primary reactance for 240V (using
Ns to Np ratio) - this with the "magic" effeciency will give the the
resulting currents?

Now for a similar situation - It I took 10 by 240V to 24V transformers and
connected the secondary windings in series and to 240V (that is 10 by 24V
secondaries) and it I then connect what was the primaries (assuming no HV
breakdown) will the output be 2400V?? Is this a possible way of making a
high current / high voltage supply? 10 by 300VA transformers will output
3000 watts at 2400V AC (or about 3400 DC no load)
Is this reasoning flawed??

news:WPKv5.8402$tj4.53534@news-server.bigpond.net.au...
> What is a ball park figure for a toridal transformer?

I would guess an efficiency of 95 percent or better. Remember what ever power you put into the transformer either comes out on the secondary, or shows up as heat. So a 1 KVA transformer may have 50 watts wasted as heat for example.

> So would I allow plus 10% or ??

I think 10 percent is too much. A value closer to 1 to 3 percent is more like it. You can measure it by plugging in the transformer, leave the secondary open circuit, and measure the current in to the primary.

>If it is rated at 24V @ 12.6A if I drive it
> in reverse will it take 24V at 14A? Will it then put out 240V at 1.25A
> (300VA)?
> Since the VA rating is on the secondary can I assume it will be the same
in
> reverse - you will get 300VA out of it just more VA going into the
> secondary?

The VA rating should be about the same either way. In a well designed transformer the I squared R loss in the copper should be about the same in the primary and the secondary windings. So the extra current, due to core magnetizing requirements, is low on the high voltage winding when driven, but the resistance of the winding is higher. If you drive the low voltage winding the magnetizing current will be higher, by about the turns ratio, but the winding resistance is lower. So the extra loss, due to the magnetizing current, is about the same regardless of which winding you drive.

> Should I work of the reactance that the secondary must have at 60Hz for
24V
> @ 12.6A and then use that to work out the primary reactance for 240V

The current the transformer windings can handle is based on the wire size, and the allowed I squared R losses.

> Now for a similar situation - It I took 10 by 240V to 24V transformers and

> high current / high voltage supply? 10 by 300VA transformers will output
> 3000 watts at 2400V AC (or about 3400 DC no load)
> Is this reasoning flawed??

No, not really. You will need to "phase" the secondary windings correctly however. The BIG assumption is "(assuming no HV breakdown)" may be flawed, which could make the idea unworkable. You really need to check the standard the transformers are designed to meet, in regards to voltage withstand ability from primary to secondary, to see if a single transformer meets a 3400 volt peak break down rating, if not, then you are out of luck. I doubt the 240 VAC transformer would meet the requirement.

As a closing comment the above is based on a sine wave voltage and current on the transformer windings. If the inverter you are going to use is a square wave, or modified square wave, the losses are going to be much higher! The reason being is the high harmonic content of the wave form which will cause extra losses due to skin effect in the windings. Plus the laminations in the core may be too thick at frequencies above 60 Hz, which results in higher core losses too.

Hi Dan: Finally, someone who posts on topic! Thanks! I know it's more expensive, but I would go for the second one. It sounds like it would suit your needs better & would be more in keeping with current technology. But, this is a tough call, not being in your shoes. I wish I could be more helpful. Good luck! Kind regards, Red Pony

Lecroy used to be a manufacturer of CAMAC and NIM style instrumentation
modules for nuclear physics. Now they also make oscilloscopes and
signal sources.

We use several of their 'scopes and I think they are quite good,
compared
to Tek and HP (or whatever they call themselves now). As for growth, I
believe they are doing quite well.

Why don't you hit their web site? (http://www.lecroy.com)

I strongly recommend you to build one of the TenTec kits. They have 3 receiver kits.
1054 - basic 4 band regenerative receiver - enclosure, speaker, etc. must be purchased separately.
1253 - 9-band regenerative receiver, easy to build, inexpensive, performs as well as or better than most commercial SW radios in the same price range. All required parts and accessories come included in the kit. I built one myself and it works really well. I think this radio meets best your project needs - easy to understand, makes a great learning project, yet quiet powerfull, can be used as a "real" receiver to log in hundreds of stations.
1254 - digital dual conversion receiver, with performance comparable to commercial receivers in the same price range. I think this is probably too much for you needs, specially if this is going to be your first project. However, you may consider it as a next step or a higher level project if you really get hooked on SWL.

Have a look at TenTec web site
http://www.tentec.com/Amateur.htm

TenTec kits have many advantages:
1.- high quality components / parts
2.- everything is included - you get what you pay for (no "hidden" items that you have buy separately at extra cost or difficult to find components).
3.- carefully engineered - they really work as specified (unlike many other kits, TenTec kits are real radios, not cheap toys).
4.- complete documentation and easy to follow step-by-step instructions,
5.- many kits to choose from - receivers, transceivers, accessories, etc.
6.- last, but not least, good technical support and customer service - in the unlikely case you have difficulties with your kit.

Take a look at http://www.elecraft.com/ for the latest info. I believe
it is being field tested by a number of people at the moment.

2396. AM class C amplifier with MRF 455 ?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-14 00:00:00 UTC
From: ItsNotMe <itsnotme@nospam.net>
Message-ID: <8pr692$23pi$1@news5.isdnet.net>
Source record: 57877

Hello everybody !

I would like to build a class C power amplifier
with one Motorola MRF 455.

Normal use of this component is for a SSB linear
amplifier and 60 W out. (It is not what i want to do with it)

This is for a shortwave AM transmitter with a tranformer
for collector modulation.
Operating conditions are very different from ssb :
{
Peak output power = 4 X carrier power
Collector max voltage = 2 X carrier collector voltage
Collector max current = 2 X carrier collector current
}

My questions are :
- the max power i can get for safe operation ?
- the power supply voltage and collector current for this ?
- the formulas you use to calculate these values ?

Transistor data :
Collector-Emitter breakdown voltage (Ic=100 mAdc Ib=0) Vceo = 18 Vdc
Collector-Emitter breakdown voltage (Ic=50 mAdc Vbe=0) Vces = 36 Vdc
Emitter -Base breakdown voltage (Ie=10mAdc Ic=0) Vebo = 4.0 Vdc
Ic continuous = 15 Adc
Total dissipation / 25�C = 175 Watts
Efficiency = 55 %

Another question :

What is the best capacitor type for use at resonant output
circuit at this level of power ?

Thanks for all information or urls you can give me.

2397. new tube reflector group

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-14 00:00:00 UTC

I have started a new tube reflector group. If you are interested in
tubes, have tubes to sell, or need tubes, this is the group for you. So
far we have over a hundred members in just the first week. So go to
QTH.com and sign up, or just send an email to: majordomo@qth.com
and in the body of the message just put the following:
subscribe tube-swap
That is all you need to do.

I have for sale a matched pair of Svetlana 4cx800a tubes. These tubes
are Soviet military surplus, and are very rugged well made tubes. These
tubes are in great shape, they have NEVER BEEN USED. These tubes will
produce as much wattage as any Svetlana 4cx800a sold by any tube
distributor, period. The tubes do have a 90 day warranty.
The price on the matched pair of 4cx800a tubes is $200.00 plus shipping.
The price on the 4cx400a tubes is $90.00 each plus shipping.
I also have the SK1A sockets for the 4cx800a tubes. The price on the
sockets is $39.95 ea. plus shipping.
Thanks for your time.

>Richard
>
>PS: Anybody remember Carl and Jerry?

Sure do. What you're describing isn't actually radio. It is using
the Earth as a sheet resistance. You can just pump audio into
the Earth via a pair of rods, then at some distance away you
can receive the audio with another pair of rods and an audio
preamp. (You need a 60 Hz filter on the preamp, otherwise it
will be swamped by power line hum.) You can vary the separation
of the rods in each pair to achieve an impedance match with
the Earth sheet resistance for the "transmitter" and "receiver"
respectively.

Years ago, after reading about this in one of Carl and Jerry's
adventures, I gave this a try. I was living in a rural area at the
time, so the noise in the Earth wasn't as bad as it is in urban
locations. I hooked the speaker output of the radio in the truck
to a pair of stakes, and had the phono cartridge input of the
radio (battery powered, REA hadn't reached the farm yet) in
the house hooked to another set of rods. I could receive the
signal clearly at a distance in excess of a quarter of a mile.

You could do this with an AM modulated ELF carrier and a more
conventional receiver too. Range would probably be worse since
you'd need double the bandwidth to pass an AM voice signal.
Direct audio excitation of the Earth is simpler, and probably better.
It is equivalent to SSB with a zero frequency suppressed carrier.

A very narrow PSK or MSK signal should be detectable quite a
long way. The "carrier" could be just the amplified output of your
sound card running PSK31. If you don't have a suitable "phono"
preamp, Ten-Tec sells a very high gain audio amplifier kit that
can be used as a "receiver" front end for your sound card. It has
the power line notch filter built in.

Battery power at both ends is recommended since it will eliminate one source of ground loops. Operating far from power lines is also a good idea to reduce hum pickup.

Perhaps I am a bit blase abt. Trichoro-ethylene (Trilene TM)
but I used it for many years as an anaesthetic agent (guess what my
daytime job is?)
and nobody ever got cancer fron such short exposure to the stuff.

I think the rats in the lab had days and months of exposure.

I would've hesitated to even mention it but saw the thinners
on the shelf at the store and remembered the dope I made from
foam with it so successfully. Others can get it easily too.

Cheers.

2409. Re: Transformer "reverse" effeciency

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-14 05:49:09 UTC
From: Noel Willis <AccessIT@Bigpond.net.au>
Message-ID: <pFZv5.8898$tj4.56995@news-server.bigpond.net.au>
Source record: 57868

Thanks for the input.
The toroidal transformers I am looking at have a "stated" dielectric strength of 4000V for 1 Minute.
How would this relate into 2400V? Any ideas if they would be up to the job?

How about if I took each 240V secondary (the original primary) thought a rectifier and filter giving something around 340V DC then I stacked these all together in series (basically 10 floating DC supplies connected in series)

To illustrate

```
240V in -------; ;-----------
| 24v input :: 240v output Full wave 340V
DC with -------------- {+}
| winding :: winding rectifier
filter caps plus bleeders------- (-)
| | ------------
| |
| | ;-----------
| 24v input :: 240v output Full wave 340V
DC with -------------- {+}
| winding :: winding rectifier
filter caps plus bleeders------- (-)
| | ------------
Repeat another 8 times
-----------
```

Now with the above we join the (+) to the (-) between the units and we should have 10x340V = 3400V.
Does this eliminate the HV primary to secondary stresses? Saves trying to buy a load of HV capacitors and strings of HV diodes
TIA
Noel

> -Dan Papasian

You may want to first consider whether you want to build something and get results, or if you are hoping to have a full blown receiver after your school project is finished.

You can build all kinds of radios that are better than a crystal radio, but which aren't too complicated or cost lots of money.

A hundred dollars is cheap for a shortwave receiver, but it's a lot of money if the project doesn't work out. And presumably, you have a fixed time in which to build the thing, and get it going.

It sounds like you may be tempted by the second receiver because you'd like something you can use afterwards. But it often makes sense to start with something simpler. Something that covers a single segment of the shortwave spectrum can be a lot easier than one that copvers everything, And some of the less easier to get components will not be needed. For that matter, a multi-band design tends to be more complicated, if only because it's expected to be a more complete design and so those expensive ICs often come into play.

Done right, there are a number of options that can start off simple, but which can later be transformed into a better receiver.

Someone mentioned building a converter, which could be as simple as three transistors, and using it with a regular AM broadcast radio. The converter translates the shortwave frequencies down to the frequencies covered by the radio. It's simple, but will give you a working shortwave receiver, though with limited frequency range. It has the advantage that the conversion is common to most receivers at this point, and it's a very basic principle of radio receivers, which might be important for the school aspect.

Once the project is over, ypu could go back and make the converter tune more than one segment of the shortwave spectrum.

Or take the regenerative receivers that a couple of people have mentioned. This too can be used to describe a basic concept of radio. It dates back to the early days of radio, and it's discovery cascaded into other facets of radio technology. Interestingly, the discoverer was Howard Armstrong, who went on to discover the concept of the superheterodyne receiver (the converter mentioned above is an example of this idea), and practical FM broadcast. While someone else probably would have come across these things if he hadn't, it is impossible to visualize radio without these techniques.

You can build the regenerative receiver for the school project, and then add a converter to get better coverage and performance later for yourself. As someone mentioned, the September 2000 issue of QST, on newsstands now, has projects for both a regenerative receiver, and a regenerative receiv er that has a converter ahead of it.

Getting the articles may be difficult, but people have written about simple receivers that start off really simple, and by adding stages later, make them more practical. Because most principles for receiving are an extension to simpler principles.

Or if you build something right, you can start with a more complicated receiver, but one which only covers one segment of the shortwave spectrum. If it's physically build right, sort of in modules, you could then come back after the school project and by scrapping only some of your work, make it cover more band segments.

You might visit the library and see what books it might have. One would hope that it has a copy of the ARRL Handbook, which comes out every year. It has theory about radio, and the basic circuits that make up a receiver, and complete construction articles, both simple and advanced. Interestingly, you're bound to find simple receivers using straightforward components in older editions, but in the more recent editions will be receivers made with parts that you may have to order, but you can actually track down.

Or maybe there will be other books that describe how to build radios. The specific books will depend on the library. Or see if the library keeps old electronic or radio magazines. You're bound to find more examples in books and magazines, so long as you can find them in the first place.

Terry,

You are quite correct, it was NOT me. I did not get my G-call until 1961
and was never into CW anyway (about five QSO's in my G3PGR career I think).

Sounds an interesting idea, but he still had a VFO in the chain.

dr

PS. So it was Droitwich, not Daventry! I think I may be confusing it with
MSF at Daventry on 2.5, 5.0 and 10.0MHz, if my memory serves me correctly.

We had a top of the range LeCroy 'scope where I used to work. It was an
excellent instrument, but *very* expensive. Our sister company, (just
bought by TI), designed the front-end ASIC used by LeCroy.

Donno about the configuration for the Motorola UHF duplexer, but for a DB products 220 MHz band pass duplexer, I added reject to it by using small glass piston trimmers in series with the coupling loop to ground. Used a grid dip meter to get the approximate series resonance but as I recall, the capacity was around 20 pfd or so. In my case, the finished product came out identical to the typical curves listed for a similar duplexer, in the catalog.

The main problem is in finding a physical mounting location for the glass trimmer that's sufficiently close to the coupling loop. Also since the addition of the capacitor restricts the ability of the loop to be rotated, one needs to know in advance as to what a target insertion loss should be and then mount the capacitor accordingly.

You need to be a bit more specific. If you are transmitting
on HF, a low pass filter is what you need. There are lots
of published designs. I use a 7 element Chebychev LPF,
details at: http://www.qsl.net/ei9gq

I hope a LPF will cure the problem but you may be disappointed.
Most HF transceivers, whether commercially made or homebrew,
are equipped with a good LPF.

TVI problems are usually caused by badly designed TV's,
pre-amp's, satellite receivers or badly screened cable
TV equipment.

Good Luck.

I have been experimenting with the various methods of making PCB's - iron on transfers, negatives, positives, DATAK transfers - I have had best success with the iron-on transfers (interesting, you can iron-on from plain letterhead with about equal results). I would be hearing people's opinions.

For one (and having dealt with a lot of organic solvents) I am not happy with the polychlorinated aromatic solvent used in DATAK's kit as the "developer".

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday September 17th 2000
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.

Non prepaid vendors will only be admitted if
space is available. :-(

Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

Dan,

I'm sorry to say that your estimate of the cost of building one of my homebrew receivers is quite a bit low.
I am currently building a second one now and even I am not exactly sure of the total cost. My estimate is somewhere in the neighborhood of $500.00 Someday I may sit down and try to figure up a more accurate estimate, but for now that's about the best I can do.

The following is for anyone who would consider building my design:

I would say that mine is a fairly ambitious project, definately not for the beginner. If anyone does build it, my advice is to build to the schematics. There are a few errors in the board layouts, after I built it, I had to make a few modifications to make it work like I wanted. The existing layouts can be made to work however, just some minor modifications. When I get new layouts made someday, I will put those on the web site.

I also plan to finish all of the technical descriptions someday. Those are only partially complete at this time. That will make it easier to understand all of the details of the radio's operation.

The high cost may not be so bad if you consider that it's going to take quite a while, probably several months to finish a project of this magnitude. The parts do not all have to be purchased a once. It will keep you busy and out of trouble for a long time. Think of it this way: If you're not doing this, you will just be doing something else, and spending your money on some other hobby or recreation. Either way, you pay for your fun.

Almost All Digital Electronics www.aade.com has a very good one for 90
dollars, in kit form. The oscillator on this unit operates at around
750KHz, so low inductance measurements can be made. The unit
self-calibrates; the only thing you need to do is auto-zero the unit.

> group seems more or less appropriate for the subject.

Maybe the project on the following link is somewhat usefull for
you:

http://home.snafu.de/graff/pixie3.html

this site is in german but very easy to understand or to
translate if neccessary, I think :-)

I stumbled over it in a german mailinglist or newsgroup.
This project is to build rather cheap and seems to be a very good
start for experimenters.

This design is usable for RX SSB and CW mode and TX in CW...

I am deeply disappointed to warn you not to deal with Warren Brooks W4WWB. He advertised a radio on ebay that was complete, but needed some work. What arrived was a parts radio - Pieces were missing and it will not power up. After he ignored my emails I contacted him by phone and in his best good ole boy drawl he told me " you bought it, you own it". He would not allow me to return it for a refund. I know that ebay is a take your own risk venture - but deliberately lying about the condition of the radio to sell it is dishonest. What a disgrace to the ham community. Don't be suckered by this man like I was.

The only way to do it with a passive (as in no power) circuit is with a varicap diode. When you "pump" a varicap at a high frequency you create a negative resistance at sub multiples of that frequency. If you then put an appropriate tank on the varicap at the sub multiple frequency you will get a sub harmonic oscillation.

Stuff like this happens all the time in power amplifiers. It is also the basis for a gizmo called a parametric amplifier. Used to be about the only way to get a low noise figure at microwaves. The only other place I have seen it is in millimeter wave frequency dividers.

In general there are easier ways to get a fractional frequency. The efficiency of a varicap divider is not very good ....

There's a variation on that theme, Bob, especially at lower frequencies (such as the 60 > 20 Hz ones discussed), namely the saturable inductor / magnetic amplifier. By using the nonlinearity of a large inductor saturating, you can do an inductive analog of the variable capacitance parametric amplifier you mention. Thus the heavy iron ring generators discussed earlier.

They sure don't teach *these* tricks in undergrad courses most places!

Most interesting... Anyone who remembers the little Drake TR22 circa ~ 1970 can properly appreaicte this addition.. TR22 had 6 xtal controlled channels on 2meter FM with a watt abd a half output to an internal telescoping antenna powered by an internal nicad battery pack, and was widely used by outdoors types. Now the same -actually smaller- space gets you 5 watts allmode DC to daylight, probably for not that many more inflation-adjusted dollars.. We've come a long way indeed.

Depending on what course you followed:

Did you contact him ahead of time (prior to bidding, or at least prior to
close of the bidding) to confirm the description.
If the radio was not as represented you can contact e-bay. They do have
recourse for things misrepresented, but they also expect you to have done
some checking ahead of time as well.

2458. Silencing Dimmers?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-18 00:00:00 UTC
From: Frazier <frazier@flex.com>
Message-ID: <39C6BA2A.EE32B318@flex.com>
Source record: 57697

I've a couple of dimmers that put out nasty noise, particularly when trying to listen to weak AM-band stations. Also have some outside security lights that supposedly use infrared sensors to turn on and off that really buzz when turned on. I suspect they use a controlled triac, much like the dimmers do. I'd like to silence them as much as possible.

I took apart one of the dimmers and there's almost nothing in there for suppression. A couple of caps that look like they are used to fire the triac, and a single inductor of indeterminate value on the load leg. What should I do to most effectively silence these things? I'm assuming the security lights are probably not very robust either, as they didn't cost an arm and a leg.

A ferrite bead on each of the line and load with the wire looped through a few times?

If so, sources and general guidelines would be a great help. About the only source we have here is Radio Shack, which is a severe shock after coming from the Silicon Valley area of California, where there are a half dozen or more surplus shops within a 20-minute drive... Needless to say, I'll probably need to do mail order, or wait until I make my next trip to California...

Thanks

This request goes back quite a little ways here. Several years ago there was a magazine printed called Electronics Illustrated (around the early 70's i believe) in one issue there was a project to build a very low frequency receiver built around a 6U8 tube and a common B+W tv horizontal sweep freq coil. What I would like to know is if anyone has this article or maybe even one of the radios that they had built. I would appreciate any help given. Please email me at:
wb9hnj@qsl.net

Thanks!!

Source record: 57700

I've seen this sort of filter in the ARRL handbook... Although, for your purposes it may well be that a simple highpass filter can knock the interfering signals down enough to fix the overload.

Something that would be good to try is to insert a fixed attenuator and see how much you need to knock out the intermod. That would tell you what the filter has to achieve.

A simple breadboard PI attenuator would be good enough at these frequencies and I'd try several attenuator values. 5 and 10 and 20 dB should tell you everything you need to know.

I'd be surprised if you need more than 20 dB and 10 dB might do it. A highpass filter to knock the broadcast band down by 10 to 20 dB is pretty straightforward.

2462. Re: Components !!! - Maplin Stores

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-18 00:00:00 UTC
From: Mike Percival <mpercival@trentontechnical.fsnet.co.uk>
Message-ID: <8qa3r3$1r$1@newsg2.svr.pol.co.uk>
Source record: 57701
Cross-posted to:
alt.electronics.maplin-electronics,rec.radio.amateur.homebrew,sci.electronics.components,sci.electronics.misc,uk.radio.amateur

I've been in the electronics game for 25 years, and remember the early days of the Maplin Catalogue when it was as much a reference book as it was a price list...in fact, the catalogue was valid for a year and they updated a separate price list on a regular basis.

Where I work, we keep copies of Maplin Cats going back to 1983...every so often in the service industry we come across a piece of 'obsolete' kit and Maplin catalogues often have IC's or suchlike that were in fashion ten years ago but discontinued more recently. Where else would you find pin-outs and example circuits for such ancient chips?!!

What gets on my nerves is that when you phone MPS or Maplin, half the stuff in the current catalogue has been discontinued 'just last week', or 'we're waiting for supplies and we've been quoted 4-6 weeks'. Part of the fun of electronics is keeping old kit alive that little bit longer, or modifying something old to improve or enhance it. What use is a PIC chip when you are trying to replace an OC71 transistor in a Roberts Radio.

The other problem I find is that very often, Maplin will come up with a 'kit' for a reasonable price that does a job we wish to do in an actual real-world application. We integrate the module or whatever into our systems as a standard item, then lo and behold, they discontinue it or bring out a revised version, which although possibly better, isn't the same. Classic example being the TDA2030 15Watt Amplifier....we used over 100 of them in end user systems, then when we had to replace or repair modules, the PCB and spec had changed!!! Muggins now has to spend time re-drilling the case and rewiring the panels!

Give them their due, they have some pretty wierd stuff, some of it completely irrelevant to industry or the come constructor, but they stock stuff that other mail order companies don't. Lets just have a little continuity please!!!

2464. Small QRP transmitters.

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-18 00:00:00 UTC
From: stuart@no.spam.please
Message-ID: <memo.20000918095728.33103B@srnet.compulink.co.uk>
Source record: 57838

I have been looking at some simple crystal controlled QRP CW transmitters.

There are plenty of circuits for 160M to 10M to be found on the web.

However they all assume, not unreasonably, that the transmitter will be connected to a tuned antenna or through an ATU.

I am interested in using such simple transmitters for RDF, but with such a unit the antenna will be no more than a foot or so of wire. Clearly this will not emit as effectively as a full length antenna, but how would you match the output impedance of a simple crystal oscillator to a short length of wire using the minimum amount of components ?

Stuart.

The easiest way is to have a 50 ohm dummy load resistor hooked up to the
transmitter, with the foot long antenna also connected to the transmitter's
output. While this might seem like a waste of power, it does protect
the output transistor.

Hi To All
Has anyone had experience with the G3SEK Tetrode Board
http://www.ifwtech.demon.co.uk/g3sek/boards/tetrode/tetrode-1.htm
You can buy an entire kit with all components, although he has generously provided all schematics and parts lists so you can build it yourself or see how it works. It seems like an excellent choice for a 4CX1600B grid driven amp I am planning to build.
Has anyone used them - seen them
TIA
Cheers

Hello,
I am looking for a website to obtain some data sheets for TPC Ferite cores. I recently purchased some .520 dia, .285 in. dia. .150 thick toroid cores, and I want to look up the part number. The exact part number escapes me now, but as I remember, it was A6??1280??. Any information would be greatly appreciated. TPC Ferite seems to be a Taiwan company, but web searches do not seem to come up with a web page.

I wound 10 turns of wire around one of these. I read around 280 uh, I am guessing these are close to a amidon number 63 mix???

still tuning 1ft wire with proper antenna tuner it is waste of power,
remember trying to use 2' long wire with my FT-250 transceiver on 80m
SSB, but got reports from few stations

2472. MW/VLF Wideband amplifier source?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-18 00:00:00 UTC
From: Frazier <frazier@flex.com>
Message-ID: <39C6B86E.156F6E80@flex.com>
Source record: 57846

Some time ago I came across an article for a wideband amplifier that would be appropriate for 150Khz through about 2 Mhz.

I need to improve AM radio reception and would like to poke around below the broadcast band as well, and am in the middle of the Pacific (on the big island of Hawaii).

As I remember, there was a nice little monolythic amplifier that needed only a dc supply and a couple of input and output caps and inductors. I've moved here fairly recently, and most of my shack is still in boxes and have no idea where the information might be.

Can anyone provide a pointer or two to on-line sources of parts or schematics?

Thanks

2473. Simple bias regulators for bipolar power amplifiers

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-18 00:01:54 UTC
From: LA8AK@online.no
Message-ID: <39c55857.105921421@news.online.no>
Source record: 57835

Modifying some FM amplifiers for 2m and 70cm, some have RF output of 150W and a Motorola amplifier has 350W, several 2 transistor bias regulators are needed. See http://www.ifwtech.com/g3sek for details of how to build a simple bias regulator.

Have tested over a douzen devices to be used as reference transistor, but still all TO126 and TO220 NPN devices tested have emitter-base forward voltage @10mA collector current at 0.54-0.58V.

BC547A (2N4401, 2N3904) and similar has 0.65-0.68V which are closer to the desired voltage, but they are keen to rectify the RF voltage present in a power amplifier

The trick to increase reference voltage is to add a resistor in series with emitter of the reference transistor, but this requires the collector current to be stable

The collector current varies as base current of power device varies with varying output current. One idea is to use MOSFET power device, but the gate voltage varies between 4.1-4.8V for output current varying 30-600mA, so unless constant current is used it is a bad solution. The power device should be darlington type and current feeding the reference transistor collector circuit needs to be stabilized (simple zener regulator will work)

Any comments, pse

I did try a single transistor xtal TX on 160M, easy to build, my digital scope will even do a spectrum check at this frequency.

Despite there being about 3v RMS at the collector of the oscillator (from a 3v supply) the radiated field was very low, I guess the efficiency of such a short whip is extremely low.

Despite the added difficulty of making an xtal TX at 144Mhz, the crystals are specials and expensive, at least its possible to get some decent antenna matching.

Am I correct in assuming that the 144mhz TX would radiate much more effectively into a short whip ?

Stuart.

Here have a print to a transmitter the size of your thumbnail.

http://homepages.go.com/homepages/j/b/g/jbgizmo/page4.html

Obviously you probably do not want to use H.F. frequencies just from the antenna requirements standpoint. I have been told 220Mhz is pretty much the ceiling on ground effect. It is probably the reason most tracking systems use it.

>George
>Where are you getting the metal boxes that you are using to house your balun?
>73 de Bob AA4RL

Bob, I use so many different types of boxes there is no one answer. The largest outdoor boxes are Hoffman NEMA 12, steel and with a gasketed door. Also use a lot of fiberglass boxes with a hinged gasketed door. The smaller ones are usually a Hammond die-cast aluminum with a screw on lid. They work well, and have proved to be water proof enough as-is. Sometimes we use a Radio Shack plastic box with a molded lid, and they work pretty good, but are showing signs of UV damage.
The best all around source for the Ham builder who needs to house a balun, a few relays or a preamp outdoors is Home Depot. GO to the electrical department, they have a whole assortment of cast aluminum boxes and lids that are intended for outdoor lighting wiring etc. Coming in a variety of sizes, they all have built in threaded holes intended for conduit. There are special fittings that also will fit those holes called "cord grips" that have a rubber grommet in a compression fitting, and you can pass a cable or coax thru there, and then tighten it down. The grommet squeezes tight for a waterproof strain relief.
Make sure you get some of the blank screw in plugs to fill the unused holes/

The 160/80 meter K0FF Loop kit uses a condulet TEE, which is also heavy cast aluminum, and has a gasketed door which you can open to get at the tuning capacitor.

Source record: 57711

Hello Homebrewers,

I'd like to ask you do somebody ever tryed to feed two antennas
(80 and 160 m. dipoles or inverted vees) with a single cable.
Due to the place deficit would be interesting to get any information
concerning this question. Most accaptable could be single antenna
with filters or other neccesary elements to split the bands - in my
location I have only two points for ropes so this construction
could be best for me.
Any information will be very welcome.
Many thanks in advance.

> Obviously you probably do not want to use H.F. frequencies just from the
> antenna requirements standpoint.

Indeed, some simple tests i have done seem to confirm the problem, very low radiation.

I tried the circuit in that link, and got it to work with at 24Mhz crystal at 144Mhz, a far from ideal harmonic I guess.

I added a loading coil to the base of the short wire, that improves radiation a bit.

To try this cct properly I have ordered a 144.050 crystal, the supplier said it was only avaialble on 7th overtone.

Also building a simple feild strength meter so I can see what's actually getting out from the cct.

Stuart.

Quick answer.....get rid of them! I changed all my outdoor lighting to compact flourescents,they draw about 25 watts each and I leave them on forever. Those cheaply made dimmers are a real nasty source of buzz, especially when it's your neighbors and you share a common pole-pig (transformer)...plus many of these lights can be had for $9.00 each. They are quiet,cool and save big bucks as they are highly inductive, the power meter hardly sees them.

2488. QRP CW on VHF on 144, 220 and 432 MHz

Hi folks:

I see plenty of QRP CW Transmitters and receivers on the HF bands, but how about projects in the VHF/UHF bands? I would be especially interested in the 220 and 432 Mhz bands. The antennae are smaller even for a Yagi.

Also, how about hams operating CW in these modes, are you out there?

I wish you a lot of luck. I believe that VHF/UHF QRP faces three problems: 1) There just is not much real activity on the weak signal portions of the bands. 2). At HF, most of the 5 watts generated in the transmitter gets to the antenna, unlike VHF where a significant portion of the power is lost in the feedline. 3). The quality/complexity of receiver and transmitter required for weak signal work at VHF is orders of magnitude greater that at HF.

Here in So. Cal, most of the non-satellite cw activity on the VHF and UHF bands takes place during contest weekends, and at or near the SSB calling frequencies. The CW portion of 2 meters is not used very much. Ditto for 6 meters, 70 cm, and 23 cm. My observations of the VHF and UHF bands here are that they are largely unused -- including the FM portions. Yes, there are lots of repeaters, but I here more activity in the evenings on the simplex frequencies than on the repeaters.

There used to be some cw only sprints on the VHF and UHF bands that produced some activity. If you have any ideas as to how to get more people on, I am sure that there are a lot of people who would be interested.

Good luck,

Tim AA6DQ

Looking for some input from homebrewers out there regarding Manhatten style board construction. Is there an advantage to it over just taking a Dremel tool and cutting pads into a pcb? I'm about to embark on some projects and would probably opt for using my Dremel rather than to try to cut and paste little pads of pcb. Any feedback appreciated. TIA.

Hi Tim:
I can see there is a lot of possiblility here. I found a web site that had a tracking transmitter for 144 and 220 and thought to myself "Self, why don't you check on the QRP web sites for QRP VHS/UHF projects."

My web search was not exactly fruitful. VHF/UHF frequencies are always finding other pathways to ground rather than be radiated from the antenna as I understand it. They get lost in coax faster and easier.The projects that use them take a lot of planning as lead lengths and proximity of the parts to each other generate impedances that are detrimental.

My purpose is tracking and RDF for the purposes of finding lost model rockets, lost model airplanes, lost cars......and maybe start up an new class of QRP contacts. More challenges.

No advantage for either: strictly a "whatever turns your crank"
issue. Why not try it yourself on a small project and see what
you think? What I think is irrelevant: it's *your* radio.

An additional alternative is ugly construction, not etching
the board at all, nor sticking any cut-up bits of circuit
board to it. Less hassle. Less work, too, which is why it's
my fave. :-)

There have been all kinds of goodies published. From stuff
published in QST, for example, you could easily come up with
a VXO transmitter, a little brick amplifier and a direct-
conversion receiver. Or team up an HF radio and a transverter.
Whatever works for you.

Who to talk to with such gear is another matter entirely.

I have gone thru many antennas etc. the best solution that i have found is a dipole 165 ft long center fed with 450 ohm open wire line. With this antenna and a blanced antenna tuner I am able to load up all bands including 160 thru 10 meters. Suggest that you look at ag6k website, he has polans for a very nice balanced antenna tuner. I built it and it really is the "cats meow".
good luck

Glenn:

I've found, to my surprise, that you can iron on the toner from a laser print of your artwork on regular paper, clean it up with a finepoint waterproof marker, and etch in regular ol FeCl with pretty good results.

I don't know if this is the best way, but it works.

I use some "microscopic hole saws" which drill a thru-hole in the PCB, and "mill" an isolated pad right around the hole. It leaves a nice ground plane around where the pads are "drilled". I have three different sizes, the smallest one is suitable for 0.1 inch spacing on ICs. They use regular drill bits for the center hole which are held in with a pair of set screws, so they are easily replaceable with bits from the local hardware.

I got them many years ago from "International Eyelets" in California somewhere (like Santa Barbara or somewhere north of LA?). Unfortunately, I think they don't have any web presence.

2501. Re: Looking for AM BCB filter

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-19 00:39:35 UTC
From: Steve Ratzlaff <sratzlaf@flash.net>
Message-ID: <39C6B5A6.F2AE59DF@flash.net>
Source record: 57702

A BCB bandnotch filter is what you're describing. Such a filter is not simple to build, nor available commercially. What you really want, and can build yourself, possibly, is two separate filters--a 500kHz lowpass filter for LF, and a 2500kc highpass filter for HF. If you're able to wind toroid inductors and somehow measure the inductance, and measure capacitors to precise values, I could give you component values for both filters. If you're not able to measure inductance or capacitance, then your best bet is to buy these filters from Kiwa, who offers them already built in boxes with connectors. Kiwa makes excellent filters.
If you're using a commercial active whip antenna, some of the intermod is coming from the antenna; but for the HF intermod, probably most of that is from the actual stations themselves. Living in an urban area with strong nearby AMBCB transmitters is not a good environment to try to do weak signal DXing.
I do some LF DXing myself in my very-urban location, but am restricted to the early morning hours due to local AC buzz. I use my own design active antenna which has good intermod performance. But even with my separate passive wire antenna I still hear lots of LF intermod during the daytime. The HF intermod is also worse during the daytime too, when the stations are all running full daytime power.

This is fine if you can form a local group of enthusiasts who build
these equipment have regular schedules with them.

Otherwise you are only going to have contacts with a few big contest
stations who have big antennas within 200 .. 300 km during some
contests. Doing some hill top operations during these contests will
help you to contact some more stations.

I am sorry for sounding so pessimistic, but many hams who bought a
multimode (CW/SSB/FM) rig (which usually have about 10 dB more
transmitter power than a QRP rig) were disappointed, since the actual
number of stations they could contact did not increase as much as they
had hoped.

The 144 MHz band might be a bit easier for CW QRP operations.

Long range (300 .. 600 km) VHF/UHF troposcatter communication requires
10 .. 30 dB more power than is available from a simple 1 .. 5 W
transmitter with a short yagi.

But as I said, if you have a enthusiastic local group with whom to
work with, there is no need to worry about these things, you can make
plenty of contacts with them.

You would probably find it easier to purchase a used LAMBDA supply on
EBay, or for that matter, a lot of instrumentation fetches pretty
inexpensive prices - just replace the front panel with a clean rack panel.

Hi Glenn -
This method of building is MUCH faster in my opinion. The trick
is to take some time and precut (actually punch) a bunch of circular pads
from some scrap pcb material. I have used extra thin PCB material and a
paper 'hole' punch and made mine. Armed with a bowl full of these pads
and a small bottle of Super Glue, you can build circuits in no time flat.
I think it's a great method of quickly building circuits. It is alot
cleaner (no dust,etc) and the results are more consistent and pleasing to
the eye. Try it..

How about some old PC box ? The power connector, power switch, indicator light and the fans could be reused :-). Remove the rest from the box, so you can fit the transformer and other large components within it.

The last time that I did this, I removed the original scale and photocopied it. I then blanked our the original numbers with correction fluid and pasted new numbers on with rubber cement. I remember printing out the new numbers in a number of fonts/sizes and selecting the one that looked best. Then I made another photocopy of the new scale, cut it out and pasted it on the back of the original using rubber cement. YMMV.

> My purpose is tracking and RDF for the purposes of finding lost model
> rockets, lost model airplanes, lost cars.....and maybe start up an new
> class of QRP contacts. More challenges.

I decided to build one after I lost a fuselage from my electric glider, the wing hold down bolt sheared off in flight, I found the wing but the fuse and approx $300 of bits were lost.

There are commercial units for wildlife tracking, the transmitters are $75 and the DF receiver $500. The operate on 160Mhz or so and have aground-ground range of 1-2Km

I have seen the 144MHz tracking transmitters circuit you refer to, I built one but only had 24MHz crystal to hand which did not produce much output at 144MHz.

I tried 160M, at least the crystals are easy to get and transmitters easy to build (and you can see the output on a scope). Unfortunately the length of antenna that is practical is so short compared to a wavelength that the radiation is very low. No more than 20M or so on my Sony SW7600G, which will receive CW/SSB.

So back to 144MHz. At this frequency it ought to be possible to put a fair bit of signal out of a short wire, after all there are numerous 'bugs' about for the FM broadcast band that have a range of 500M - 1Km and more.

I have ordered a 'proper' 144MHz crystal to see how much output a single transistor is capable of at 3V.

I found a circuit for a simple field strength meter, this will be needed to check the radiated field and see what makes matters worse/better.

I intend to use a 3V lithium rechargeable button cell and a PIC micro controller to modulate the transmission and pulse the output to save power. Why rechargeable ? , so I can pot the lot in lightweight resin/filler to make it shock resistant and moisture resistant.

Just off to the local electronics emporium to buy some bits for the field strength meter.

Stuart.

Yup -- a "...selector in a stereo receiver..." is what you're
looking for.
Go to the nearest Goodwill Store (or, its equivalent) and buy one
of those old, old Sears AM/FM/Phono/8-Track/Cassette dinosaurs and
gut it out -- that'll give you a set of 5 interlocking pushbutton
switches at about 4PDT per section --- and A LOT of other NICE
CRAPPE.

In a local Rehab Retail Store here these (donated) stereos go
for $5-$10.

Beyond that -- I'm surprised that Jameco doesn't have such a beast.

Date: Wed, 20 Sep 2000 01:06:43 -0500
From: w9wi@bellsouth.net
Subject: Old switch wanted

I'm working on a project that could use two switches. Each is actually
an array of DPDT pushbuttons, mechanically interlocking so that only one
switch in a group can be closed at a time. Kinda like a source selector
in a stereo receiver, or something like that. Each switch needs to have
at least four pushbuttons - five would be nice, and I can certainly take
more & just not wire the extras. Any physical arrangement (that weighs
less than 5 pounds<grin>) is fine. Current and voltage rating not
important, they'll be switching 12 volts DC at a dozen milliamps or so.
I could really use two of them, but even one is worthwhile.

Such things don't seem to exist in the new product world anymore. I
suppose they've been obsoleted by cheap microprocessors for new
designs...

Anyone know where I might find such a thing? (or have anything in their
junkbox they'd be willing to sell or trade?)

(I have checked most of the obvious (to me) parts houses - Jameco, All
Electronic, Mouser, even Radio Shack. I might very well be missing one
though.)

I don't operate 432MHz and we don't have a 220MHz amateur band here in Ireland. Last year I built a simple CW transmitter for 2M. I made many contacts via the RS13 satellite (2M up 10M down). I worked several U.S. and Canadian stations and lots of Europeans. You will find details of the transmitter at: http://www.qsl.net/ei9gq

There's lots of CW activity on 6M. I use 10W from a homebrew transverter and a simple delta loop. I managed to work PY5CC who is almost 6000 miles away.

Have fun on VHF/UHF. You may lose a few decibels in the feeder but this loss can be offset by the gain of a good beam aerial.

I've had really good luck by removing the meter face and using an
eraser shield (remember those things from drafting class?) erasing
the numbers but leaving the scale arc...then using pressure sensitive
letters/numbers to recalibrate the meter face. Works great, easy
to do and fast. One just has to be careful and not overdo the erasing
or you'll go down to base metal.

VR136: UHF superhet receiver.

The receiver's black case may be for rack mounting.
The front panel has chrome handles.
The dial is plated and engraved brass; and showing signs of wear.

Model/Type No. AP-55267
Frequency coverage: - 530-600 MHz.
Has tuning-bar, to change frequency of the push-pull oscillator.
The VR97 minature valve either triode, or diode is located in the tuner cluster of components.

The tube compliment: -

Originally,
No. Valve: Function:
2 - VR97 Located in tuner.
4 - VR136 (EF54) I.F.
1 - 6Q7 Detector.
1 - 6J5 A.F.
1 - 6X5 Rectifier

Not sure if 6X5 is original.
Serial No. MF92
Manufacturer?: MSV, c.1944 Copyright.

Modified:
2 - 6AQ5 A.F.

Audio amplifier and new power transformer has been fitted by an amateur radio person.

Further contributions of information about the receiver may be of interest: -
Circuitry, specifications and attributes in operation.

2528. changing panel meter faces?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-20 02:45:59 UTC
From: lagagnon@fakesprint.ca
Message-ID: <39c820b7.6843906@news.sprint.ca>
Source record: 57734

Some time ago I remember seeing some suggestions on methods to change the card faces of panel meters. I have a 1mA panel meter that I want to calibrate in volts and amps, it is a surplus item currently calibrated 0-100. Other than a quick and nasty job with a felt pen does anyone have a more professional method to create a different card face?

I have attempted something with some simple CAD software but it all seems to be a bit much attempting to get the measurements exactly right. Any help would be appreciated.

2529. constructing aluminum project cabinets?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-20 02:45:59 UTC
From: lagagnon@fakesprint.ca
Message-ID: <39c822e6.7403095@news.sprint.ca>
Source record: 57735

Due to the outrageous prices of larger project boxes (i.e. for a 20amp
12v power supply) I'd like to make my own from sheet aluminum and
small aluminum angle stock. There is a brief write-up of ideas in the
ARRL handbook on this subject but I'm looking for a bit more detail.
Does anyone know of a good online tutorial anywhere which deals with
such construction....or anyone have any good hints on how to do it
with minimal tools?

Any help would be appreciated.

> >location I have only two points for ropes so this construction
> >could be best for me.

That's what I use on 160 and 80m, with good success. I simply put up both dipoles sharing a single balun and coaxial feedline. It's important to tune the right band first -- one of the bands will affect the other, but not the other way around. Unfortunately, I forget which way it works! Anyway, if you change the length of one of the dipoles, be sure to check the resonance on the other band.

I do have enough space that the far ends (away from the feedpoint) of the dipoles are about 25-30m apart. I have seen some designs where the ends are much closer though. (one design used 5-conductor flat rotor cable to form 5 dipoles, for 80/40/20/15/10. I never tried it so I have no idea whether it works!)

2531. Old switch wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-20 06:06:43 UTC
From: w9wi@bellsouth.net
Message-ID: <39C853F3.9A600E7B@bellsouth.net>
Source record: 57737

I'm working on a project that could use two switches. Each is actually an array of DPDT pushbuttons, mechanically interlocking so that only one switch in a group can be closed at a time. Kinda like a source selector in a stereo receiver, or something like that. Each switch needs to have at least four pushbuttons - five would be nice, and I can certainly take more & just not wire the extras. Any physical arrangement (that weighs less than 5 pounds<grin>) is fine. Current and voltage rating not important, they'll be switching 12 volts DC at a dozen milliamps or so. I could really use two of them, but even one is worthwhile.

Such things don't seem to exist in the new product world anymore. I suppose they've been obsoleted by cheap microprocessors for new designs...

Anyone know where I might find such a thing? (or have anything in their junkbox they'd be willing to sell or trade?)

(I have checked most of the obvious (to me) parts houses - Jameco, All Electronic, Mouser, even Radio Shack. I might very well be missing one though.)

A local suggested something Radio Shack sells - it's designed for switching RF into a TV and a VCR. It contains one 5-button array and a second 4-button and sells for $30. Looks like it's going to be the way to go. I get a reasonably attractive box in the process - so I won't have to look at my ugly nibbling tool work... A few foils will have to be cut and a row of F connectors replaced with a barrier strip, but that should be pretty simple.

wrote:

>The gain of a 4 meter dish is 10dB???

The physical are of a 4 m dish is 12 mï¿½ and the effective capture are
for is about 5 .. 8 mï¿½ depending illumination and other factors.

The capture area for a simple free standing dipole is about 0.13
square wavelengths.

On 2 m wavelength the capture area of the free standing dipole is
about 0.5 mï¿½, on 70 cm about 0.06 mï¿½.

The dish gain on 2 m would thus be 5 mï¿½/0.5 mï¿½ = 10 or 10 dBd,
on 70 cm 5 mï¿½/0.06 mï¿½ = 78 or 19 dBd.

I see that stuff on their website (and it looks like it would indeed do what I need) but best I can tell it would need to be imported from the UK, it doesn't look like they have an affiliate here in the States. Which probably isn't a big deal, just that I've never tried to import electronic components.

In any case, a local suggested a certain device Radio Shack sells for switching RF signals into TVs and VCRs, which should be easily modifiable for my purposes - and save most of the chassis bashing in the process.

One I have used is the 'Slim Jim' from G2BCX, F.C.Judd. Published in Practical Wireless magazine.

Take some stiff rod and bend into a 3/4 wavelength (59.5") high loop around 1" wide. There is a 1" break on one side at the 1/4 point from the bottom.

Connect the co-ax with a bit of terminal block on either side approx 4" from the bottom. Slide the connections up/down to match. Hang from the ceiling tree etc.

I made a roll up version from 300 ohm ribbon feeder, which was almost as effective as the ally rod version.

G2BCX claimed that the ground plane radiation is close to 0deg, compared to 30deg for a 5/8 vertical with 1/4 wave radial and included polar plots in the article to prove the point.

Goniometer (from Greek gonia, angle) measures angles. I deduce
"radiogoniometer" is a radio direction finder, though it's a
usage new to me.

Robert, there are such circuits available, but try searching
under "radio direction finder", "RDF", or "fox hunt". Also
consult amateur handbooks at your local library under "fox hunt."

And here in the U.S., the manager of the local Radio Shack refers to
the electronic components as "forcefeed", because they are forced to
stock it, by the higher-ups. It's definitely not their favorite line to
carry...

Hi all,
Have the following enclosed 19 inch rack cabinets for sale:

Unit #1 - Not sure but appears to be manufacured By Premier Metal
Products
Can be used as single or together. - Slopping front
Color - Brown and tan
Dimensions - Slopping panel area - 21 inches
Total height - 54 inches
Overal width of both units - 42-1/2 inches
Single unit width - 21-3/4 inches
These units are used and in very good condition. Complete with rear
doors, side removeable panels and lower panels. $100.00 for the pair
plus shipping.

Unit #2 - Have 2 units - Manufactured by IBM - These are new/never used
- cratted
Color - Beige
Dimensions: Panel space - 35 inches
Total height - 39-1/4 inches
Total depth - 30 inches
Total width - 21-1/4 inches
Has spring load casters mounted on bottom, 10 inch fan mounted on the
rear door, Waber 120Vac outlet strip mounted inside and all new hardware
bagged.
$100.00 each plus shipping.

Purchased originally for amplifier projects.

I've always wondered how to do this. It seems to me that the solutions proposed so far, although I guess they get you to the final product, are brute-force methods. Surely, there has to be a simple piece of software that lets you plot arcs with numbers above or below them, print the result and allow me to paste the new face on the old one or something like that. Any solutions out there along these lines?

R,

Al W6LX

> usage new to me.

The real goniometer is a set of fixed/rotating coils, originally
used in the Belini-Tosi direction finding systems about 1910 or so.
It was comprised of a set of 3 coils arranged on a vertical axis
with two fixed 90 degrees and the other rotating on a shaft. Two
large open at the top triangular shaped antennae, phased at
90 degrees apart were hung on a single vertical pole several
hundred feet tall were then connected to the goniometer. The
antennae went to the fixed coils and the receiving set went to
the rotating coil. The receiving set was basically an early tuner.
The pickup coil then connected the goniomenter to the primary circuit
of the tuner (back then it was a xtal set, although a Fleming valve
could be used instead of a xtal). To obtain the direction of a
signal, the goniometer was rotated until a null was achieved,
(I think it was a null and not the maxima), and then the direction
read off the dial of the goniometer. Since it was bidirectional,
you had to ascertain from which direction the signal was coming
by triangulation from several stations and plotting a direction
intersect. For more details, see Elmer Bucher, 1917, Practical
Wireless Telegraphy, and other works of the era. The basic
goniometer was used in many other direction finding systems
since then. I dunno if the goniometer predates the Belini-Tosi
system, back earlier than about 1910, but it might.

2550. Using Radio Ant. as 2-meter Ant.

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-21 00:00:00 UTC
From: davo.dana@spam.home.com
Message-ID: <BXwy5.190258$6y5.111753907@news2.rdc2.tx.home.com>
Source record: 57777

I 'm wondering about using my auto radio antenna as a 2-meter antenna. This would mean sharing the antenna with the radio and shielding the radio with a low pass filter. I ran across and article or web site with all the details a short time ago but can't seem to find it again. May have been in my father-in-law's '80s QST stack.

In case you're wondering why I'd bother well it's for my truck which I sometimes use to transport a truck camper. This prevents me from using a roof mount antenna.

Thanks for any help,

Davo

2551. Re: changing panel meter faces? Try PostScript(tm)

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-21 23:37:30 UTC
From: rice@ironbark.bendigo.latrobe.edu.au
Message-ID: <rice-ya02408000R2209001037300001@news.latrobe.edu.au>
Source record: 57778

If you have access to a laser printer that speaks postscript, then it is possible to write the meter scale directly in PostScript(tm). I have done this a couple of times: the results look good (to me anyway ;-)

For a sample postscript meter face, please email. (I won't annoy everyone by posting it here ;-)

In London Ontario Canada...

--- There are still a few tables left! ---

London Amateur Radio Club has another hamfest on the way. This is expected to be the biggest and best ever at our new location! Computers, radio equipment and electronics flea market! See the web site for more details!

www.larc.on.ca

Lot's of free parking! Food on site! Almost out of vendor tables!!
Reserve tickets early! Slots next door!

LARC HAMFEST 2000
SUNDAY, SEPT. 24TH
9:00 AM TO 1:00 PM
VENDORS SETUP 8:00 AM
ADMISSION: $6.00, TABLES: $8.00

More details at http://www.larc.on.ca

I have an Ameritron QSK-5 T/R switch which switches up to 2.5 Kw in 50 ohm relatively flat lines. The diodes used are labled types 4PH301 and 4P4001B. I don't know how these would work at the potentially quite high RF voltages that would be present on an antenna loading coil. I'd guess that this might be a pretty tough design problem.

Source record: 57782

I used to cut a half wave wire dipole and insert it into some 1/2 inch plastic water pipe with a "T" at the center and a short piece of half inch inserted into the "T". That gave the wire some rigidity.

Worked quite well, but I preferred making a ground plane out of an SO-239 chassis connector and some stiff copper wire.

My wife is an Occupational Therapist, and OTs currently use modern goniometers to measure range of motion of human hands. In this application, it has nothing to do with radio equipment.
It is a calibrated mechanical squeeze device.
It's funny how terms go through re-use after years.

Re-use? The radio direction finder goniometer MEASURES the ANGLE of the signal source, and the goniometer that the OT uses MEASURES the ANGLE of the range of motion of the hand (or other body part).

Source record: 57657

Once upon a time ....

There was an article in a very early 73 or perhaps even Pop'tronics when it was a small page format. It started off with an anecdote about the author (Wayne Green?) and an experience in the military on a submarine. As the story went, he had an audio amplifier feeding a transformer of some sort and the two leads when into the water at some distance apart. His experiment was based on the WWI practice of sending telegraph between the trenches using spikes pounded in the ground. As the story goes, his experiment worked OK and it took the stuff apart and went about his duties. Sometime later he overheard the Sonar Ops discussing the strangest thing they had heard - music, and someone saying "Hello Test"????

The construction portion of the article was basically feeding audio into two ground rods separated by as far as practical. The farther apart the rods the greater the distance to the receiver could be. The receiver was two ground rods, feeding a transformer input to an amplifier.

I have a small panel-mounted goniometer that looks like it just came out of the factory. The shellac or varnish finish still shines.

Basically, it is as Bob described: a couple of fixed coils surrounding a rotatable coil. The phase of the signal induced in the rotatable coil is a function of the phase(s) of the exciting current(s) in the fixed coils and the mechanical angle of the rotatable coil. Very simple and effective.

Hadn't thought about that thing in years, but I know exactly where it is in the garage, despite what my wife says! <:}

More to my original posting of a few minutes ago:

Had a burst of memory activity and recalled that these small units were widely used back in the teens and 20's in regen receivers. They were sometimes known by the name "Three Circuit Tuner."

Although they work on goniometric principles, I believe that the phase information in the rotatable coil pickup was discarded and the rotation used primarily as means for varying coupling.

Anyone remember anything about this stuff?

Check out 80/20 Inc's line of flexible structural systems. This consists
of lengths of aluminum channel with milled slots for Tee nuts, various
angle couplers, joining plates, panel mount blocks, handles, hinges, etc.
All you need to add is aluminum sheet to construct any sort of enclosure.
This is an inexpensive and very flexible building system. A hand hacksaw
and a screwdriver are the only tools you'll need to produce enclosure frames
with this system. Reid Tool Supply, www.reidtool.com , handles the system.
(You should have Reid's catalog, they have a huge selection of knobs, pulleys,
handles, latches, etc that you'll find very useful for any home mechanical
construction.)

Aluminum sheet in various sizes and thicknesses is available from any
number of metals suppliers. One online source of aluminum sheet is Online
Metals, www.onlinemetals.com , another is Metalmart www.metalmart.com .
Both will cut to order. I recommend sticking to 6061 T6 alloy for most enclosure
needs, and 1/8th inch thickness is about right for sheet in enclosures needing
to support heavy components (3/16ths to 1/4 is about right for angle). A local
metals scrapyard is another source, cheaper, but dirtier, and you'll have to
take whatever odd sizes and alloys they may have. For other hardware, try
Small Parts Inc, www.smallparts.com . They're a little pricey, but they have
a huge stock of odds and ends that you'll find useful.

(Note, you may want to use steel or brass instead of aluminum for some
things. The above mentioned suppliers have that too.)

Trying to build sturdy enclosures from the hardware store's hobby metals
rack is going to be an exercise in frustration. Everything is too thin, the wrong
alloy, or the wrong size. Go with one of the industrial suppliers who can get
you the right materials in the right sizes.

If you're going to try to build enclosures from raw stock rather than using the
building system I mentioned, you'll want a shear and brake. Harbor Freight,
Grizzly Industrial, J&L Industrial, MSC, etc all carry suitable shears and brakes
beginning at about $360 and going up (to the stratosphere) from there. For
anything other than the lightest gauge materials, you need these tools.

A TIG welding outfit will also be very useful. Miller's 180SD is a very nice unit which does aluminum (caution, DC TIG is only useful on ferrous metals, you must use AC TIG with a high frequency arc sustain for aluminum, the 180SD has this, most small welders don't). I have a 180SD and recommend it highly. Lincoln's Square Wave 175 is another suitable machine. (Don't be put off by the 175 to 180 amp ratings of these machines, you need a lot of current to weld aluminum.) You *can* weld aluminum with a torch, but it is a very demanding skill, and requires messy flux. TIG is much easier, and produces much nicer results.

Lots of things are better welded than riveted or bolted together, but rivets have a place. Particularly, nut sets have a place. These are installed like pop rivets, but they have internal threads. This is ideal for the many situations where you need a blind nut in a panel or frame. You can tap aluminum panels and frames, but the nut sets are generally stronger and much less likely to strip out. Check with MSC or J&L Industrial for nut sets and their installation tools.

If you want to do formed aluminum instead of just rectangular boxes, you may also want to purchase (or build) an English wheel. This allows you to form complex curves. Leather shot bags and rawhide mallets can also be used for some shaping tasks, but it takes a good bit of skill to make the results look professional.

Remember, measure twice, cut once. And speaking of cutting, Harbor Freight sells a Taiwanese 6x4 metal cutting bandsaw for as little as $139 (free freight) when it is on sale. This is an excellent tool at an incredible price. Highly recommended. If you buy it, immediately throw away the trashy blade that comes with it and install a bimetal Lennox blade. It'll make a huge difference.

Good description of goniometer construction. Goniometers
are used in many situations requiring precise phase angle
measurement or precise variable phase angle generation.
For phase measurement, two signals of the same frequency,
but differing phase, are applied to the fixed coils and the variable
coil is adjusted until a null is detected. A scale is then read to
get the relative phase angle between the two signals.

For variable phase generation, the two fixed coils are driven in
quadrature, and the rotating coil is adjusted to get an output
signal of the desired phase angle. This is commonly done in
vectorscopes. The reference phase is adjusted with the
goniometer until the signal being measured lines up with
the reference marks on the CRT face. The relative phase
shift in degrees is then read off of the goniometer dial.

This can also be used in reverse to convert a polar magnitude
and phase to X and Y signals. In this case, the rotating coil is
driven, and the X and Y outputs are taken from the fixed coils.
If the rotating coil is turned by a radar dish (directly, or indirectly
via synchros), the resulting X and Y values can be applied to a
CRT's deflection plates to get the familiar rotating sweep display
synchronized with the dish rotation.

The Merrimac 113C is a 10 to 500 Mhz 0 degree 2-way power divider/combiner.

Cross-posted to: alt.ham-radio.mods,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Can the wideband modification be done on kenwood th79a with serial number after 609001? Mine has serial number 6120XXXX, the diodes are all there but I'm afraid to cut them if the mod will not work. THANKS!

Reuben

Hello--
I recall buying these pad-cutters from A. F. Stahl (or was it Stahler???)
some years ago.

Also, I bought a similar but cruder tool from one of those floating "tool sales"

that make the rounds of V.F.W. halls in our area every couple of years.
The tool is used for cutting automotive sheet-metal spot welds and has a
center drill and a miniature "hole saw" that'll chew through copper and leave
an isolated pad with center hole.

Hello--
You can also use a sliver of hot-melt glue to secure the pads (I wrote an article

for 73 mag a number of years ago about this method). Use high-temperature,
high-strength glue, and put a flake between the bottom of the pad and the
substrate
or ground plane (which must be clean and free of oil, corrosion, etc.).
Then, you tin the top of the pad, and the glue will melt and secure the pad. You
can
solder component leads to the pad as you tin it.

Advantages: a quarter-inch circula hole punch ($.99) will make LOTS of pads
before it gets dull; you can put a pad anywhere (to fix an oversight); you can
use a substrate board that already has traces in place.

Disadvantages: the pad tends to "skate" on its molten glue; some technique
is required to use this method; if you repeatedly solder to a pad, you may
"cook" the glue and need a new pad (and glue).

Breadboards built using this technique tend to take up a lot of area but not much height.

As for longevity, I still have the original boards I built for the 73 article, and the pads have stayed in place for several years. Still, I wouldn't use this method for any circuitry that gets really hot during operation.

2596. Need Info On Brown Amplifying Relay

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-24 00:00:00 UTC
From: "P. Friedrichs" <NOSPAMpfriedr@azstarnet.com>
Message-ID: <39CEDAF0.157C7E95@azstarnet.com>
Source record: 57675

Hi:

I'm wondering if anyone has an example of, or has information on the "Brown Amplifying Relay". In a nutshell, the Brown was an electromechanical amplifier from the early wireless days. Your tuner and detector were connected to a coil on an armature. The armature acted on a flexible reed of some sort. The read featured a button of carbon, which in turn touched againsted a fixed contact. As the coil current varied (audio), the reed flexed, disturbing the unstable contact between the carbon button and the fixed contact. The latter two acted like a primitive carbon microphone, which was connected in series with some local batteries. The result was modest amplification. It was claimed that several of these could be cascaded to provide 30-35x amplification.

The local current was also fed to a second set of coils, wound on the same armature, that acted to provide a D.C. bias to the field, which served, I think, to keep the contact in an operating region most sensitive to the audio signal.

I have been tinkering in an attempt to build one, with virtually no success. The most sensitive of the Brown Relays used a carbon button and some sort of iridium/osmium alloy for a fixed contact. Why? The less sensitive varieties used carbon/carbon. I've tried using the carbons extracted from dry cells with no luck? Any ideas why?

Several old radio and electrical books I have feature plans for homebrew carbon microphones made from dry cell carbons. I have been at a loss even to replicate those.

Does anyone have a Brown Relay? A few bitmaps might help me work out the mechanical details. All I presently have is a basic schematic, and an engraving showing a side view of the device.

Has anyone played with homebrew carbon microphones? What was your secret to success? Are they doing something to modern-day dry cell carbons that make them unsuitable for experiments of this type? Any idea of other materials to use?

Please remove NOSPAM from my address to replay, and thanks in advance.

Pete

THIS REALLY WORKS!!!!!!!!!!!! (9/6/00 04:40 PM EDT)
Email: bmullins@henry-net.com
Date: 9/222/00
Time: 6:35p.m.

Message:

READING THIS COULD CHANGE YOUR LIFE! I found this=20
on a=20
bulletin board and decided to try it. A little while back, I was =
browsing=20
through newsgroups, just like you are now, and came across an article=20
similar to this that said you could make thousands of dollars within=20
weeks with only an initial investment of $6.00! So I thought, "Yeah=20
right, this must be a scam", but like most of us, I was curious, so I =
kept=20
reading. Anyway, it said that you send $1.00 to each of the 6 names=20
and address stated in the article. You then place your own name and=20
address in the bottom of the list at #6, and post the article in at =
least=20
200 newsgroups. (There are thousands) No catch, that was it. So after=20
thinking it over, and talking to a few people first, I thought about =
trying=20
it. I figured: "what have I got to lose except 6 stamps and $6.00, =
right?"=20
Then I invested the measly $6.00. Well GUESS WHAT!!...within 7=20
days, I started getting money in the mail! I was shocked! I figured it=20
would end soon, but the money just kept coming in. In my first week, I=20
made about $25.00. By the end of the second week I had made a total=20
of over $1,000.00! In the third week I had over $10,000.00 and it's =
still
growing. This is now my fourth week and I have made a total of just=20
over $42,000.00 and it still coming in rapidly. It's certainly worth=20
$6.00, & 6 stamps, I have spent more than that on the lottery!! Let me=20
tell you how=20
this works and most importantly, why it works....Also, make sure you=20
print a copy of this article NOW, so you can get the information off of=20
it as you need it. I promise you that if you follow the directions =
exactly,=20
```

that you will start making more money than you thought possible by=20
doing something so easy! Suggestion: Read this entire message=20
carefully! (print it out or download it.) Follow the simple directions =
and=20
watch the money come in! It's easy. It's legal. And, your investment is=20
only $6.00 (Plus postage) IMPORTANT:=20
This is not a rip-off; it is not indecent; it is not illegal; and it is =
virtually=20
no risk - it really works!!!! If all of the following instructions are=20
adhered to, you will
receive extraordinary dividends. PLEASE NOTE: Please follow these
directions EXACTLY, and $50,000 or more can be yours in 20 to 60=20
days. This program remains successful because of the honesty and=20
integrity of the participants. Please continue its success by carefully=20
adhering to the instructions. You will now become part of the Mail=20
Order business. In this business your product is not solid and tangible, =

it's a service. You=20
are in the business of developing Mailing Lists. Many large=20
corporations are happy to pay big bucks for quality lists. However,=20
the money made from the
mailing lists is secondary to the income which is made from people=20
like you and me asking to be included in that list. Here are the 4 easy=20
steps to success: STEP 1: Get 6 separate pieces of paper and write the=20
following on each piece of paper "PLEASE PUT ME ON YOUR=20
MAILING LIST." Now get 6 US $1.00 bills and place ONE inside=20
EACH of the 6 pieces of paper so the bill will not be seen through the=20
envelope (to prevent thievery). Next, place one paper in each of the 6=20
envelopes and seal them. You should now have 6 sealed envelopes,=20
each with a piece of paper stating the above phrase, your name and=20
address, and a $1.00 bill. What you are doing is creating a service.=20
THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate=20
service and you are paying for it! Like most of us I was a little=20
skeptical and a little worried about the legal aspects of it all. So I=20
checked it out with the U.S. Post Office (1-800-725-2161) and they=20
confirmed that it is indeed legal! Mail the 6 envelopes to the following =

addresses:

#1) Samantha Blizniak, 7937 S. Newcastle, Burbank, IL 60459

#2)Katie Wiess, 14 White Tail Lane, Wallingford, CT 06492

#3)Traci Wood, 4224 Carnwath Rd., Tallahassee, FL 32303

#4)Milissa Crook, 3730 South 255th Place, Kent, WA 98032

#5)James Buckner, 11903 Coit RD. #1803 Dallas, TX 75251

#6)Bobbi Mullins, 31 Sunnydale Lane, Napoleon, OH 43545

STEP 2: Now take the #1 name off the list that you see above, move=20
the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR=20

Name as number 6 on the list. STEP 3: Change anything you need to,=20
but try to keep this article as close to original as possible. Now, post =

your amended article to at least 200 newsgroups. (I think there are=20
close to 24,000 groups) All you need is 200, but remember, the more=20
you post, the more money you make! This is perfectly legal! If you=20
have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal=20
lottery laws. Keep a copy of these steps for yourself and, whenever=20
you need money, you can use it again, and again. PLEASE
REMEMBER that this program remains successful because of the=20
honesty & integrity of the participants & by their carefully adhering to =

the directions. Look at it this way. If you are of integrity, the =
program=20
will continue and the money that so many others have received will=20
come your way. NOTE: You may want to retain every name and=20
address sent to you, either on a computer or hard copy and keep the=20
notes people send you. This VERIFIES that you are truly providing a=20
service. (Also, it might be a good idea to wrap the $1 bill in dark =
paper=20
to reduce the risk of mail theft.) So, as each post is downloaded and =
the=20
directions carefully followed, six members will be reimbursed for their=20
participation as a List Developer with one dollar each. Your name will=20
move up the list geometrically so that when your name reaches the #1=20
position you will be receiving thousands of dollars in CASH!!! What an=20
opportunity for only $6.00 ($1.00 for each of the first six=20
people listed above) Send it now, add your own name to the list and=20
you're in business!=20
---DIRECTIONS -----=20
FOR HOW TO POST TO NEWSGROUPS----------=20
Step 1) You do not need to re-type this entire letter to do your own=20
posting. Simply put your cursor at the beginning of this letter and drag =

your cursor to the bottom of this document, and select 'copy' from the=20
edit menu. This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of=20
the blank page. From the 'edit' menu select 'paste'. This will paste a=20
copy of the letter into notepad so that you can add your name to the
list.=20
Step 3) Save your new notepad file as a .txt file. If you want to do =
your=20
postings in different settings, you'll always have this file to go back =
to.=20
Step 4) Use Netscape or Internet explorer and try searching for various=20
newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new=20
message by highlighting the text of this letter and selecting paste from =

the edit menu. Fill in the Subject, this will be the header that =
everyone=20

sees as they scroll through the list of postings in a particular group,
click the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you have to do is jump to different=20
newsgroups and post away, after you get the hang of it, it will take=20
about 30 seconds for each newsgroup! **REMEMBER, THE MORE=20
NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL=20
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200** That's=20
it! You will begin receiving money from around the world within days!=20
You may eventually want to rent a P.O.Box due to the large amount of=20
mail you will receive. If you wish to stay anonymous, you can invent a=20
name to use, as long as the postman will deliver it. **JUST MAKE
SURE ALL THE ADDRESSES ARE=20
CORRECT.** Now the WHY part: Out of 200 postings, say I receive=20
only 5 replies (a very low example). So then I made $5.00 with my
name at #6 on the letter. Now, each of the 5 persons who just sent me=20
$1.00 make the MINIMUM 200 postings, each with my name at #5=20
and only 5 persons respond to each of the original 5, that is another=20
$25.00 for me, now those 25 each make 200 MINIMUM posts with=20
my name at #4 and only 5 replies each, I will bring in an additional=20
$125.00! Now, those 125 persons turn around and post the MINIMUM=20
200 with my name at #3 and only receive 5 replies each, I will make an=20
additional $626.00! OK, now here is the fun part, each of those 625=20
persons post a MINIMUM 200 letters with my name at #2 and they=20
each only receive 5 replies, that just made me $3,125.00!!!=20
Those 3,125 persons will all deliver this message to 200 newsgroups
with my name at #1 and if still 5 persons per 200 newsgroups react I=20
will receive $15,625,00! With an original investment of only $6.00!=20
AMAZING! When your name is no longer on the list, you just take the=20
latest posting in the newsgroups, and send out another $6.00 to names=20
on the list, putting your name at number 6 again. And start posting=20
again. The thing to remember is: do you realize that thousands of=20
people all over the world are joining the internet and reading these
articles everyday?, JUST LIKE YOU are now!! So, can you afford
$6.00 and see if it really works?? I think so... People have said, "what
if the plan is played out and no one sends you the money? So what!
What are the chances of that happening when there are tons of new
honest users and new honest people who are joining the internet and
newsgroups everyday and are willing to give it a try? Estimates are at=20
20,000 to 50,000 new users, every day, with thousands of those
joining the actual internet.Remember, play FAIRLY and HONESTLY
and this will really work

perfectly legal! If=20
you
have any doubts, refer to =
Title 18 Sec.=20
1302 & 1341 of the Postal
lottery laws.=20
Keep a copy of these steps for yourself and, whenever
you need money, you can use it again, and again.=20
PLEASE
REMEMBER that this program =
remains=20
successful because of the
honesty =
&=20
integrity of the participants & by their carefully adhering to=20

the directions. Look at it this =
way. If you=20
are of integrity, the program
will continue=20
and the money that so many others have received will
come your way. NOTE: You may want to retain every name and=20

address sent to you, either on a =
computer or=20
hard copy and keep the
notes =
people send you.=20
This VERIFIES that you are truly providing a
service. (Also, it might be a good idea to wrap the $1 bill in =
dark paper=20

to reduce the risk of mail =
theft.) So, as=20
each post is downloaded and the
directions=20
carefully followed, six members will be reimbursed for their =

participation as a List Developer with one dollar =
each. Your=20
name will
move up the list =
geometrically so=20
that when your name reaches the #1
position=20
you will be receiving thousands of dollars in CASH!!! What an =

opportunity for only $6.00 ($1.00 for each of the =
first six=20

people listed above) Send it now, =
add your=20

own name to the list and
you're =
in business!=20

---DIRECTIONS ----- =

FOR HOW TO POST TO NEWSGROUPS---------- =

Step 1) You do not need to re-type this entire =
letter to do=20
your own
posting. Simply put your =
cursor at=20
the beginning of this letter and drag
your=20
cursor to the bottom of this document, and select 'copy' from the=20

edit menu. This will copy the =
entire letter=20
into the computer's memory.
Step =
2) Open a=20
blank 'notepad' file and place your cursor at the top of =

the blank page. From the 'edit' menu select =
'paste'. This will=20
paste a
copy of the letter into =
notepad so=20
that you can add your name to the
list.=20

Step 3) Save your new notepad =
file as a .txt=20
file. If you want to do your
postings in=20
different settings, you'll always have this file to go back to. =

Step 4) Use Netscape or Internet explorer and try =
searching=20
for various
newsgroups (on-line =
forums,=20
message boards, chat sites, discussions.)
Step=20
5) Visit these message boards and post this article as a new =

message by highlighting the text of this letter =
and selecting=20
paste from
the edit menu. Fill in =
the=20
Subject, this will be the header that everyone

sees as they scroll through the list of postings in a =
particular=20
group,
click the post message =
button. You're=20
done with your first one!
Congratulations...THAT'S IT! All you have to do is jump to =
different=20

newsgroups and post away, after =
you get the=20
hang of it, it will take
about 30 =
seconds for=20
each newsgroup! **REMEMBER, THE MORE
NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL =

MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200** =
That's=20

it! You will begin receiving =
money from=20
around the world within days!
You =
may=20
eventually want to rent a P.O.Box due to the large amount of =

mail you will receive. If you wish to stay =
anonymous, you can=20
invent a
name to use, as long as =
the postman=20
will deliver it. **JUST MAKE
SURE =
ALL THE=20
ADDRESSES ARE
CORRECT.** Now the =
WHY part:=20
Out of 200 postings, say I receive
only 5=20
replies (a very low example). So then I made $5.00 with =
my
name at #6 on the letter. Now, each of the 5 =
persons who just=20
sent me
$1.00 make the MINIMUM =
200 postings,=20
each with my name at #5
and only =
5 persons=20
respond to each of the original 5, that is another

$25.00 for me, now those 25 each make 200 MINIMUM posts with=20

my name at #4 and only 5 replies =
each, I will=20
bring in an additional
$125.00! =
Now, those=20
125 persons turn around and post the MINIMUM
200 with my name at #3 and only receive 5 replies each, I will =
make an=20

additional $626.00! OK, now here =
is the fun=20
part, each of those 625
persons =
post a=20
MINIMUM 200 letters with my name at #2 and they
each only receive 5 replies, that just made me $3,125.00!!!=20

Those 3,125 persons will all =
deliver this=20
message to 200 newsgroups
with my =
name at #1=20
and if still 5 persons per 200 newsgroups react I
will receive $15,625,00! With an original investment of only =
$6.00!=20

AMAZING! When your name is no =
longer on the=20
list, you just take the
latest =
posting in the=20
newsgroups, and send out another $6.00 to names
on the list, putting your name at number 6 again. And start =
posting=20

again. The thing to remember is: =
do you=20
realize that thousands of
people =
all over the=20
world are joining the internet and reading these
articles everyday?, JUST LIKE YOU are now!! So, can you=20
afford
$6.00 and see if it really =
works?? I=20
think so... People have said, "what
if the=20
plan is played out and no one sends you the money? So =
what!
What are the chances of that happening when there =

```
are tons of=20
new
honest users and new honest =
people who are=20
joining the internet and
newsgroups everyday=20
and are willing to give it a try? Estimates are at
20,000 to 50,000 new users, every day, with thousands of=20
those
joining the actual =
internet.Remember,=20
play FAIRLY and HONESTLY
and this =
will really=20
work

The "goniometers" that do this are known as synchro resolvers. They have the usual 3 phase type stators and a rotor that has 2 windings on electrical axes separated by 90 degrees. Position info from the synchro system is applied to the stator and the rotor produces rotating XY signals for a CRT. Rotation of the resolver provides a way of adding an offset.

2600. qrp as vfo

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-25 00:00:00 UTC
From: jwodell@provide.net
Message-ID: <39d02b5c.659105@news.provide.net>
Source record: 57681

Anyone ever try using a qrp kit as a VFO? As a 50 year ham, who has never succeeded in making a stable vfo, it seems a viable alternative.

You just build the oscillator and the transmitter chain parts, leaving out the final and the things in the RX not necessary.

There must be something wrong with this idea!

I understand that the ear-phone microphone combinations was also
used as a telephone amplifier. They were quickly replaced by tube
amplifiers.

You might search literature for early telephone equipment.

2602. Indelible Ink Removal

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-25 00:00:00 UTC
From: Norm Melick <henmel@worldnet.att.net>
Message-ID: <39CF7E97.FF2E9E05@worldnet.att.net>
Source record: 57683

I'm curious. I buy non working equipment and restore it to keep me off the streets. I end up with "NON WORKING" , or "AS IS" scrawled in indelible ink across the front of the unit.

Is there any way to remove this indelible ink off these plastic and metal parts?

Thanks,

Norm/KQ6SD

Norm,

That is an interesting question.

I work in the industrial printing business and
I can tell you that some inks, when used on
plastic, migrate into the plastic, and cannot
be removed short of using emery cloth.

Other inks, come off easily if the proper solvent
is used. It depends on what kind of ink we are
talking about.

On metal surfaces, try alcohol or acetone. Keytone
works also, but is much more aggressive. DO NOT
use acetone/keytone on plastic.

With water-based inks like those used in most
marking pens, any household solvent like
Windex or Formula 409 should do. Even good
old soapy water should remove most inks.

I know that this is not much more than you already
know, but hopefully somebody out there has a better
answer!

I can build pretty good vfo's, but I do find a good use for a spare Kenwood TS-140 is as a vfo, with the power down all the way. It puts out maybe 100mw into a 50 ohm line to drive an ancient Navy synthesizer rig with a busted synthesizer.

2606. Re: below ground radio wave transmitter

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-25 00:00:00 UTC
From: Dick <Dick@langwang.demon.co.uk>
Message-ID: <OzSWtMA5iyz5EwmZ@langwang.demon.co.uk>
Source record: 57687

This type of underground communication is not a relic of the past,
wearing my 'aged' potholer/caver ('spelunker' to those of you in the
Colonies) hat this is one of the techniques we are currently using. However,
when you're flat out in a water-filled rock tube with 4" airspace, hammering 2
spikes into the rock just to talk to someone does rather loose it's appeal,
'specially when the water's freezing, you've forgotten to repair that
strategically located hole in the wet suit & a magnetic loop made up of offset
computer ribbon cable wrapped round your helmet will do nearly as good a
job !!

Mind you, with the concerns being expressed about e.m. radiation &
magnetic fields from mobile phones & power lines etc. should we be worrying
about what this will be doing to our brains or just accept that to be a caver
means by definition we must be mad anyhow ?

Seriously, anyone interested in what's going on in underground
comms. today might be interested in the Cave Radio & Electronics Group of
the Brit. Cave Research Assoc. (www.caves.org.uk). Their publ. is excellent
& virtually all the equipment is, by it's nature, homebrew.

_____=
____________
Attention!! This is not a scam, this is the real deal--this is money in =
your pocket!
Note: I made the $6 leap of faith and it is paying off big time! You =
should too.
Just read what is below and see for yourself. This will change your =
life:

$6 Investment to make $1000s

: Make A Lot Of Money Fast !!!!!

:=20
: A while back, I was browsing newsgroups, just like you, I came across =
an article similar to this that said you could make thousands of CASH =
within weeks with only an initial investment of $6.00 plus stamps! So I =
thought, "Yeah, right, this must be a scam!" But like most of us I was =
curious and kept reading. It said that if you send $1.00 to each of the =
6 names and addresses listed in the article, you could make thousands in =
a very short period of time. You then place your own name and address at =
the bottom of the list at #6, and post the article to at least 300 =
newsgroups. (There are about 32,000 of them out there and that's quite a =
large market pool). No catch, that was it. Even though the investment =
was a measly $6, I had three questions that needed to be answered before =
I could get involved in this sort of thing.=20

: 1. IS THIS REALLY LEGAL? I called a lawyer first. The lawyer was a =
little sceptical that I would actually make any CASH but he said it WAS =
LEGAL if I wanted to try it. I told him it sounded a lot like a chain =
letter but the details of the system (SEE BELOW) actually made it a =
legitimate legal business.=20

: 2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD? I called them: =
1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18, h =
sections1302 NS 1341 of Postal Lottery Laws). This clarifies the program =
of collecting names and addresses for a mailing list.=20

: 3. IS IT RIGHT? Well, everyone who sends me a buck has a good chance =
of getting A LOT of CASH ... a much better chance than buying a lottery =
```

ticket!!! So, having these questions answered, I invested EXACTLY $7.92 =
... six $1.00 bills and six 32 cent postage stamps ... and boy am I glad =
I did!!! Within 7 days, I started getting CASH in the mail! I was =
shocked! I figured it would end soon and didn't give it another thought. =
But the CASH continued coming in. In my first week I made between $20 to =
$30. By the end of the second week I had a made a total of $1,000.00. In =
the third week I had over $10,000.00 and it was still growing. This is =
now my fourth week and I have made a total of just over $42,000 and it's =
still coming in...=20

: It's certainly worth $6.00 and 6 stamps !!! Also, make sure you print =
a copy of this article NOW, so you can get the information off of it as =
you need it. I promise you that if you follow the directions exactly, =
that you will start making more CASH than you thought possible by doing =
something so easy! Suggestion: Read this entire message carefully! =
(print it out or download it.) Follow the simple directions and watch =
the CASH come in! It's easy. It's legal. And, your investment is only =
$6.00 (Plus postage) IMPORTANT: This is not a rip-off; it is not =
indecent; it is not illegal; and it is virtually no risk - it really =
works!!!! If all of the following instructions are adhered to, you will =
receive extraordinary dividends.=20

: PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or =
more can be yours in 20 to 60 days. This program remains successful =
because of the honesty and integrity of the participants. Please =
continue its success by carefully adhering to the instructions. You will =
now become part of the Mail Order business. In this business your =
product is not solid and tangible, it's a service. You are in the =
business of developing Mailing Lists. Many large corporations are happy =
to pay big bucks for quality lists. However, the CASH made from the =
mailing lists is secondary to the income which is made from people like =
you and me asking to be included in that list.=20

: Here are the 4 easy steps to success:=20

: STEP 1: Get 6 separate pieces of paper and write the following on each =
piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 =
bills and place ONE inside EACH of the 6 pieces of paper so the bill =
will not be seen through the envelope (to prevent thievery). Place one =
paper in each of the 6 envelopes and seal them. You should now have 6 =
sealed envelopes, each with a piece of paper stating the above phrase, =
your name and address, and a $1.00 bill. What you are doing is creating =
a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate =
service and you are paying for it! Like most of us I was a little =
skeptical and a little worried about the legal aspects of it all. So I =
checked it out with the U.S. Post Office (1-800-725-2161) and they =
confirmed that it is indeed legal! Mail the 6 envelopes to the following =
addresses:=20

:=20
:=20

: #1) Aditya Venkataraman 14215 Lake Trail Driv Sugar Land, Texas 77478=20

: #2) Charlie Baltimore 71-20 Sutton Place #3 Fresh Meadows, NY 11365=20

: #3) Shaun Littman 3061 Clubhouse Road Merrick, N.Y. 11566=20

: #4) Joseph Morris P.O. Box 37 Union Grove, Al 35175=20

: #5) M. Dixon P.O. Box 767412 Roswell, GA 30076

: #6) Lee Higginbotham 8505 Columbus Ave. #209 North Hills, CA 91343
:=20
: STEP 2: Now take the #1 name off the list that you see above, move the =
other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as =
number 6 on the list. DO NOT JUST COPY OVER THE LAST NAME, BUT REMEMBER =
TO MOVE EACH NAME UP ONE LINE!!!!!!!!=20

: STEP 3: Change anything you need to, but try to keep this article as =
close to original as possible. Now, post your amended article to at =
least 300 newsgroups. (I think there are close to 32,000 groups) All you =
need is 300, but remember, the more you post, the more CASH you make!=20

: This is perfectly legal! If you have any doubts, refer to 18 Sec. 1302 =
& 1341 of the Postal lottery laws. Keep a copy of these steps for =
yourself and, whenever you need CASH, you can use it again, and again.=20

: PLEASE REMEMBER that this program remains successful because of the =
honesty and integrity of the participants and by their carefully =
adhering to the directions. Look at it this way. If you are a person of =
integrity, the program will continue and the CASH that so many others =
have received will come your way.=20

: NOTE: You may want to retain every name and address sent to you, =
either on a computer or hard copy and keep the notes people send you. =
This VERIFIES that you are truly providing a service. (Also, it might be =
a good idea to wrap the $1 bill in dark paper to reduce the risk of mail =
theft.) So, as each post is downloaded and the directions carefully =
followed, six members will be reimbursed for their participation as a =
List Developer with one dollar each. Your name will move up the list so =
that when your name reaches the #1 position you will be receiving =
thousands of DOLLARS in CASH!!! What an opportunity for only $6.00. Send =
it now, add your own name to the bottom of the list and you're in =
business!=20

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS=20

: Step 1) You do not need to re-type this entire letter to do your own =
posting. Simply put your cursor at the beginning of this letter and drag =
your cursor to the bottom of this letter, and select 'copy' from the =
edit menu. This will copy the entire letter into the computer's memory.=20

: Step 2) Open a blank 'notepad' file and place your cursor at the top =
of the blank page. From the 'edit' menu select 'paste'. This will paste =
a copy of the letter into notepad so that you can add your name to the =
list.=20

: Step 3) Save your new notepad file as a .txt file. If you want to do =
your postings in different settings, you'll always have this file to go =
back to.=20

: Step 4) Use Netscape or Internet explorer and try searching for =
various newsgroups (on-line forums, message boards, chat sites, =
discussions.)=20

: Step 5) Visit these message boards and post this article as a new =
message by highlighting the text of this letter and selecting paste from =
the edit menu. Fill in the Subject, this will be the header that =
everyone sees as they scroll through the list of postings in a =
particular group, click the post message button.=20

: You're done with your first one! Congratulations...THAT'S IT! All you =
have to do is jump to different newsgroups and post away, after you get =
the hang of it, it will take about 30 seconds for each newsgroup!=20

: **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE CASH YOU WILL =
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 300** That's it! You will begin =
receiving CASH from around the world within days! You may eventually =
want to rent a P.O.Box due to the large amount of mail you will receive. =
If you wish to stay anonymous, you can invent a name to use, as long as =
the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE =
CORRECT.**=20

: Now the WHY part:=20

: Out of 300 postings, say I receive only 7 replies (a very low =
example). So then I made $7.00 with my name at #6 on the letter. Now, =
each of the 7 persons who just sent me $1.00 make the MINIMUM 300 =
postings, each with my name at #5 and only 7 persons respond to each of =
the 7 original 7, that is another $49.00 for me, now those 49 each make =
300 MINIMUM posts with my name at #4 and only 7 replies each, I will =
bring in an additional $343.00! Now, those 343 persons turn around and =
post the MINIMUM 300 with my name at #3 and only receive 7 replies each, =
I will make an additional $2401.00! OK, now here is the fun part, each =
of those 2401 persons post a MINIMUM 300 letters with my name at #2 and =
they each only receive 7 replies, that just made me $16,807.00!!! Those =
16807 persons will all deliver this message to 300 newsgroups with my =
name at #1 and if still 7 persons per 300 Newsgroups react I will =
receive $117,649.00! With an original investment of only $6.00! And some =
stamps. AMAZING! When your name is no longer on the list, you just take =
the latest posting in the newsgroups, and send out another $6.00 to =
names on the list, putting your name at number 6 again. And start =
posting again.=20

: The thing to remember is: Thousands of people all over the world are =
joining the internet and reading these articles everyday? JUST LIKE YOU =
are now!! So, can you afford $6.00 and see if it really works?? I think =
so... People have said, "what if the plan is played out and no one sends =
you the CASH? So what! What are the chances of that happening when there =
are tons of new honest users and new honest people who are joining the =

internet and newsgroups everyday and are willing to give it a try? =
Estimates are at 20,000 to 50,000 new users, every day, with thousands =
of those joining the actual internet. Remember, play FAIRLY and HONESTLY =
and this will really work.=20

: ** By the way, if you try to deceive people by posting the messages =
with your name in the list and not sending the CASH to the rest of the =
people already on the list, you will NOT get as much. Someone I talked =
to knew someone who did that and he only made about $150.00, and that's =
after seven or eight weeks! Then he sent the 6 $1.00 bills, people added =
him to their lists, and in 4-5 weeks he had over $10k. This is the =
fairest and most honest way I have ever seen to share the wealth of the =
world without costing anything but our time!!! You also may want to buy =
mailing and e-mail lists for future CASH.=20

: Remember, HONESTY IS THE BEST POLICY. You don't need to cheat, the =
basic idea is to make the CASH!! GOOD LUCK to all and please play fairly =
and reap the huge rewards from this, which is tons of extra CASH. Keep =
an eye on the newsgroups and when the cash has stopped coming (that =
means your name is no longer on the list), you just take the latest =
posting at the newsgroups, send another $6.00 to the names stated on the =
list, make your corrections (put your name at #6) and start posting =
again.=20

: $$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!=20

: GOOD LUCK!!!=20

------=_NextPart_000_0169_01C027BF.025C15C0

charset="iso-8859-1"

----------=

Attention!!=20
This is not a scam, this is the real deal--this is money in your=20
pocket!
Note: I made the $6 leap of faith and it is paying off =
big=20
time! You should too.
Just read what is below and see for=20
yourself. This will change your life:

$6 Investment to make =
$1000s

: Make A Lot Of Money Fast =
!!!!!

:
: A while back, I was browsing =
newsgroups,=20
just like you, I came across an article similar to this that said you =

could make=20
thousands of CASH within weeks with only an initial investment of $6.00 =
plus=20
stamps! So I thought, "Yeah, right, this must be a scam!" But like most =
of us I=20
was curious and kept reading. It said that if you send $1.00 to each of =
the 6=20
names and addresses listed in the article, you could make thousands in a =
very=20
short period of time. You then place your own name and address at the =
bottom of=20
the list at #6, and post the article to at least 300 newsgroups. (There =
are=20
about 32,000 of them out there and that's quite a large market pool). No =
catch,=20
that was it. Even though the investment was a measly $6, I had three =
questions=20
that needed to be answered before I could get involved in this sort of =
thing.=20

: 1. IS THIS REALLY LEGAL? I called a =
lawyer first.=20
The lawyer was a little sceptical that I would actually make any CASH =
but he=20
said it WAS LEGAL if I wanted to try it. I told him it sounded a lot =
like a=20
chain letter but the details of the system (SEE BELOW) actually made it =
a=20
legitimate legal business.

: 2. IS OK WITH THE POST OFFICE OR IS =
IT MAIL=20
FRAUD? I called them: 1-800-725-2161 and they confirmed THIS IS =
ABSOLUTELY=20
LEGAL! (See 18, h sections1302 NS 1341 of Postal Lottery Laws). This =
clarifies=20
the program of collecting names and addresses for a mailing list. =

: 3. IS IT RIGHT? Well, everyone who =
sends me a=20
buck has a good chance of getting A LOT of CASH ... a much better chance =
than=20
buying a lottery ticket!!! So, having these questions answered, I =
invested=20
EXACTLY $7.92 ... six $1.00 bills and six 32 cent postage stamps ... and =
boy am=20
I glad I did!!! Within 7 days, I started getting CASH in the mail! I was =

shocked! I figured it would end soon and didn't give it another thought. =
But the=20
CASH continued coming in. In my first week I made between $20 to $30. By =

the end=20
of the second week I had a made a total of $1,000.00. In the third week =
I had=20
over $10,000.00 and it was still growing. This is now my fourth week and =
I have=20
made a total of just over $42,000 and it's still coming in... =

: It's certainly worth $6.00 and 6 =
stamps !!! Also,=20
make sure you print a copy of this article NOW, so you can get the =
information=20
off of it as you need it. I promise you that if you follow the =
directions=20
exactly, that you will start making more CASH than you thought possible =
by doing=20
something so easy! Suggestion: Read this entire message carefully! =
(print it out=20
or download it.) Follow the simple directions and watch the CASH come =
in! It's=20
easy. It's legal. And, your investment is only $6.00 (Plus postage) =
IMPORTANT:=20
This is not a rip-off; it is not indecent; it is not illegal; and it is=20
virtually no risk - it really works!!!! If all of the following =
instructions are=20
adhered to, you will receive extraordinary dividends.

: PLEASE NOTE: Please follow these =
directions=20
EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program =
remains=20
successful because of the honesty and integrity of the participants. =
Please=20
continue its success by carefully adhering to the instructions. You will =
now=20
become part of the Mail Order business. In this business your product is =
not=20
solid and tangible, it's a service. You are in the business of =
developing=20
Mailing Lists. Many large corporations are happy to pay big bucks for =
quality=20
lists. However, the CASH made from the mailing lists is secondary to the =
income=20
which is made from people like you and me asking to be included in that =
list.=20

: Here are the 4 easy steps to success: =

: STEP 1: Get 6 separate pieces of =
paper and write=20
the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING =
LIST." Now=20

get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper =
so the=20
bill will not be seen through the envelope (to prevent thievery). Place =
one=20
paper in each of the 6 envelopes and seal them. You should now have 6 =
sealed=20
envelopes, each with a piece of paper stating the above phrase, your =
name and=20
address, and a $1.00 bill. What you are doing is creating a service. =
THIS IS=20
ABSOLUTELY LEGAL! You are requesting a legitimate service and you are =
paying for=20
it! Like most of us I was a little skeptical and a little worried about =
the=20
legal aspects of it all. So I checked it out with the U.S. Post Office=20
(1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6=20
envelopes to the following addresses:

:
:

: #1) Aditya Venkataraman 14215 Lake =
Trail Driv=20
Sugar Land, Texas 77478

: #2) Charlie Baltimore 71-20 Sutton =
Place #3 Fresh=20
Meadows, NY 11365

: #3) Shaun Littman 3061 Clubhouse Road =
Merrick,=20
N.Y. 11566

: #4) Joseph Morris P.O. Box 37 Union =
Grove, Al=20
35175

: #5) M. Dixon P.O. Box 767412 Roswell, =
GA=20
30076

: #6) Lee Higginbotham 8505 =
Columbus Ave.=20
#209 North Hills, CA 91343
:
: STEP 2: Now take the #1 name off =
the list=20
that you see above, move the other names up (6 becomes 5, 5 becomes 4, =
etc...)=20
and add YOUR Name as number 6 on the list. DO NOT JUST COPY OVER THE =
LAST NAME,=20
BUT REMEMBER TO MOVE EACH NAME UP ONE LINE!!!!!!!!

: STEP 3: Change anything you need to, =
but try to=20
keep this article as close to original as possible. Now, post your =
amended=20
article to at least 300 newsgroups. (I think there are close to 32,000 =
groups)=20
All you need is 300, but remember, the more you post, the more CASH you =
make!=20

: This is perfectly legal! If you have =
any doubts,=20
refer to 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy =
of=20
these steps for yourself and, whenever you need CASH, you can use it =
again, and=20
again.

: PLEASE REMEMBER that this program =
remains=20
successful because of the honesty and integrity of the participants and =
by their=20
carefully adhering to the directions. Look at it this way. If you are a =
person=20
of integrity, the program will continue and the CASH that so many others =
have=20
received will come your way.

: NOTE: You may want to retain every =
name and=20
address sent to you, either on a computer or hard copy and keep the =
notes people=20
send you. This VERIFIES that you are truly providing a service. (Also, =
it might=20
be a good idea to wrap the $1 bill in dark paper to reduce the risk of =
mail=20
theft.) So, as each post is downloaded and the directions carefully =
followed,=20
six members will be reimbursed for their participation as a List =
Developer with=20
one dollar each. Your name will move up the list so that when your name =
reaches=20
the #1 position you will be receiving thousands of DOLLARS in CASH!!! =
What an=20
opportunity for only $6.00. Send it now, add your own name to the bottom =
of the=20
list and you're in business!

: ---DIRECTIONS ----- FOR HOW TO POST =
TO NEWSGROUPS=20

: Step 1) You do not need to re-type =
this entire=20
letter to do your own posting. Simply put your cursor at the beginning =

of this=20
letter and drag your cursor to the bottom of this letter, and select =
'copy' from=20
the edit menu. This will copy the entire letter into the computer's =
memory.=20

: Step 2) Open a blank 'notepad' file =
and place=20
your cursor at the top of the blank page. From the 'edit' menu select =
'paste'.=20
This will paste a copy of the letter into notepad so that you can add =
your name=20
to the list.

: Step 3) Save your new notepad file as =
a .txt=20
file. If you want to do your postings in different settings, you'll =
always have=20
this file to go back to.

: Step 4) Use Netscape or Internet =
explorer and try=20
searching for various newsgroups (on-line forums, message boards, chat =
sites,=20
discussions.)

: Step 5) Visit these message boards =
and post this=20
article as a new message by highlighting the text of this letter and =
selecting=20
paste from the edit menu. Fill in the Subject, this will be the header =
that=20
everyone sees as they scroll through the list of postings in a =
particular group,=20
click the post message button.

: You're done with your first one!=20
Congratulations...THAT'S IT! All you have to do is jump to different =
newsgroups=20
and post away, after you get the hang of it, it will take about 30 =
seconds for=20
each newsgroup!

: **REMEMBER, THE MORE NEWSGROUPS YOU =
POST IN, THE=20
MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 300** That's =
it! You=20
will begin receiving CASH from around the world within days! You may =
eventually=20
want to rent a P.O.Box due to the large amount of mail you will receive. =
If you=20
wish to stay anonymous, you can invent a name to use, as long as the =

postman=20
will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.** =

: Now the WHY part:

: Out of 300 postings, say I receive =
only 7 replies=20
(a very low example). So then I made $7.00 with my name at #6 on the =
letter.=20
Now, each of the 7 persons who just sent me $1.00 make the MINIMUM 300 =
postings,=20
each with my name at #5 and only 7 persons respond to each of the 7 =
original 7,=20
that is another $49.00 for me, now those 49 each make 300 MINIMUM posts =
with my=20
name at #4 and only 7 replies each, I will bring in an additional =
$343.00! Now,=20
those 343 persons turn around and post the MINIMUM 300 with my name at =
#3 and=20
only receive 7 replies each, I will make an additional $2401.00! OK, now =
here is=20
the fun part, each of those 2401 persons post a MINIMUM 300 letters with =
my name=20
at #2 and they each only receive 7 replies, that just made me =
$16,807.00!!!=20
Those 16807 persons will all deliver this message to 300 newsgroups with =
my name=20
at #1 and if still 7 persons per 300 Newsgroups react I will receive=20
$117,649.00! With an original investment of only $6.00! And some stamps. =

AMAZING! When your name is no longer on the list, you just take the =
latest=20
posting in the newsgroups, and send out another $6.00 to names on the =
list,=20
putting your name at number 6 again. And start posting again. =

: The thing to remember is: Thousands =
of people all=20
over the world are joining the internet and reading these articles =
everyday?=20
JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really =
works?? I=20
think so... People have said, "what if the plan is played out and no one =
sends=20
you the CASH? So what! What are the chances of that happening when there =
are=20
tons of new honest users and new honest people who are joining the =
internet and=20
newsgroups everyday and are willing to give it a try? Estimates are at =
20,000 to=20
50,000 new users, every day, with thousands of those joining the actual=20

internet. Remember, play FAIRLY and HONESTLY and this will really work.=20

: ** By the way, if you try to deceive =
people by=20
posting the messages with your name in the list and not sending the CASH =
to the=20
rest of the people already on the list, you will NOT get as much. =
Someone I=20
talked to knew someone who did that and he only made about $150.00, and =
that's=20
after seven or eight weeks! Then he sent the 6 $1.00 bills, people added =
him to=20
their lists, and in 4-5 weeks he had over $10k. This is the fairest and =
most=20
honest way I have ever seen to share the wealth of the world without =
costing=20
anything but our time!!! You also may want to buy mailing and e-mail =
lists for=20
future CASH.

: Remember, HONESTY IS THE BEST POLICY. =
You don't=20
need to cheat, the basic idea is to make the CASH!! GOOD LUCK to all and =
please=20
play fairly and reap the huge rewards from this, which is tons of extra =
CASH.=20
Keep an eye on the newsgroups and when the cash has stopped coming (that =
means=20
your name is no longer on the list), you just take the latest posting at =
the=20
newsgroups, send another $6.00 to the names stated on the list, make =
your=20
corrections (put your name at #6) and start posting again.

As mentioned, alcohol (methyl, ethyl, iposopropyl) will work on many
inks, and is unlikely to damage paint or plastics.

WD-40 is a fine solvent, and removes a number of inks, but is bad for
some plastics.

Hardware stores sell something called "Goof Off" which removes all
types of stains and graffitti. It may also remove paint that you wish
to keep.

Happy trails,
Gary

Money. It seems a pricey way to solve a simple problem. My
usual recipe for a stable VFO is a little postage-stamp
size SMD board and a toroid with hefty wire stuck to the back
of a variable capacitor. Seal the works in a box, or mummify it
in bubble packing and it will stay put. The VFO/buffer on
page 36 of Solid State Design for the Radio Amateur works
a treat this way.

PA0KSB's Huff and Puff circuit works well too. All the usual
references.

I tried this a couple of years ago. The QRP TX in question was The Ugly Weekender from the handbook. Think I used it to drive my hallicrafters HT-40. I didn't leave out the final, because I figured (somehow) that I needed the full 1.5 watts drive to do the job.

The only trick part was impedance matching. I think I decided that I was driving a control grid of a couple thousand ohms Z with a 50 ohm output transmitter. So I came up with an L-network--a toroid inductor and a shunt cap. The only tricky part came in when I realized the shunt cap was already part of the transmitter's grid circuit so I just needed the inductor. As I recall, it provided just about the right amount of drive.

Goof Off is da bomb!<grin>

Okay, here's an example:
I'm a Jeep lover('97 TJ Sahara moss green with tan rag-top
and 30" wheel/tire pkg. H-D suspension pkg,etc.) Jeep owners,
like many Hams, are a eccentric and cantankerous lot at times.
In my case, if there's one thing I hated about my Jeep it was
those damn WARNING labels on my visors screaming about air-
bag safety,etc. Right in my face all the time. And besides, it's MY
Jeep and I don't want those permanent painted decals all over
MY Jeep-- get it?

Some Goof-off and a little elbow grease was all it took.
Now my Jeep looks like it oughta: Clean and pretty with no Big
Brother labels slapped all over the inside. Goof-off worked great
for me and it didn't eat up my vinyl visors either. Highly reccomend
for any such needs. Does have an odor, so careful of fumes. Don't
think I'd clean any glow-bugs with it<wink>.

One of the Navy's (older) finest ship board receivers 4 through 28 mHZ with
power supply and power supply and speaker connectors.
The agc meter has the range to allow the receiver to be used as a tuned
voltmeter.
We are moving from the area and this and other lab equipment and components
must go.
The receiver is yours for a (non-profit institution) contribution statement.
The lab equipment and components are negotiable.
FOB northern New Jersey.

Uh, you probalby mean R46A, not S46A, right? According to the Hallicrafters collector guide, it was used with the SX-62A, SX-100, SX-101, SX-101A, and others

>2) what is the value of the speaker today?

Valued at $30-$50 in the book (your mileage may vary, of course).

Well, Manhattan style uses tomato sauce ...

Seriously, you're on the right track--it was named for looking like a city skyline, but the buildings are all single story, not stacked up.

You glue (generally super glue) little pads of circuit board onto an unetched circuit board substrate (ground plane), to use as tie-points. Kinda neat, it gives you a lot of flexibility to lay out as you go and to change layouts easily.

I also like ugly style, but Manhattan is probably easier when you have to remove a component.

For a picture of what it looks like try http://www.qsl.net/k8iqy/

This shows the famous (in QRP circles) 2N2/40 40 meter transceiver and also has tips on Manhattan style.

I've built a DC receiver to go along with my 74HC240 transmitter...the rig's now an xcvr. The rig operates from 14.047 to 14.068 VXO. AM BCI doesn't seem to be too bad but last night Radio Canada International was overwealming! I'm in Mobile Alabama and there may be a transmitter nearby...I don't know. I looked at RCI's schedule and they're either above or below the 20m band.

I'm thinking about a bandpass filter to tone down the BCI. Is the DC receiver prone to SW BCI QRM too??

>Money. It seems a pricey way to solve a simple problem.

Making VFO's is a bit of a black art. I have put
a lot of effort into building a good VFO, thick wire
on a ceramic former, well stabilised supply, good
buffer etc. Quite often, the result has been a
poor VFO with unacceptable frequency drift.

At other times I have broken all the rules and
built a VFO using the proverbial 38 gauge wire
on a toilet roll tube and built a very stable
VFO.

It is not too difficult to build a stable VFO for
frequencies below 10MHz. For higher frequencies,
consider using a PLL, a huff & puff stabiliser
as recommended by Laura, or my combined digital
display and VFO stabiliser.
http://www.qsl.net/ei9gq/stab.html

Another option is a DDS. The AD9850 is a
popular choice (only for those with good eyesight).

As a last resort, accept that you will drift a few
hundred Hz per hour and try to find another station
that is drifting in the same direction :-)

I built a Pixie which has the same problem, different station though. I reduced the BCI by putting it in a metal enclosure, and using one of the 5 element chebychev (sp) high pass filters from the ARRL handbook. The filter that worked best for me was the one with 3.3mh inductors and 2200 pf caps on each end with a 1200 pf cap in the middle.

I still need to come up with a way to filter the incoming signal a bit more as I can hear stations at least 10khz on either side of me which makes copy a little rough if the band is busy. HI HI

For cleaning old labels and markings off used equipment that I have bought, I usually use bug and tar remover from an auto parts store. It's strong enough to remove most of the uglys but not so strong to affect the unit's paint or plastic. For loosening glue and labels I soften with solvent and scrape with a piece of plastic or fiberglass circuit board. These homemade tools are soft enough not to leave scratches.

Usually I start with soap/water and alcohol, then the bug remover if needed.

>Before you buy.

One of the problems with building a VFO is that, if the transmitter design is using a straight through approach (e.g., no frequency mixing), you have to be very concerned with a backwave caused by radiation from the VFO getting into the receiver. It only takes microwatts (or less) to complete cover up a weak signal in the receiver.

The obvious approach, that of switching the VFO on and off when needed, is usually not an acceptable solution. The problem is that the heating and cooling caused by turning the VFO on and off causes the value of components to change, and this causes the frequency of the VFO to drift. (This is the voice of experience speaking.)

One approach to solving this problem is to frequency shift the VFO slightly when it is not needed. By moving the VFO signal slightly

during receive periods, the power dissipation remains essentially constant, and there is no frequency shift when going from receive to transmit. The problem, though, is that you have to be absolutely sure that the VFO switches at the correct time, and that it doesn't jump between frequencies. Additionally, you have to be sure that the transmitter has enough isolation when disengaged that it doesn't allow any of the VFO signal to pass through it (or, that the VFO itself doesn't radiate enough of a potentially out of band signal to cause problems).

Another approach is to use two oscillators, one typically crystal control, or, at least, fixed frequency, and the other variable frequency, with both producing frequencies above the desired frequency. Then, when the VFO signal is needed, the two frequencies are mixed together, and a low-pass filter is used to select the difference in the two frequencies. This allows both oscillators to run continuously, yet the backwave problem is eliminated since the output of the VFO is only present when the mixer is enabled. The drawback of this approach is that since the two oscillators are higher in frequency than the desired output, they tend to be a little less stable. But, given good design techniques, this shouldn't be a problem. The other problem is that you have to be absolutely sure that the output has had all of the other frequency products from the mixer removed (e.g., sum, F1, and F2). This may require equipment which the typical home-brewer does not have.

Dave

Source record: 57599

Robert,

For best results you will need a well screened receiver, one that does not pick up any signal when the antenna is disconnected or shorted. Signals and noise "leaking" directly into the receiver will skew the null point of the antenna and reduce its sharpness.

I used a totally enclosed (metal box) vacuum tube receiver with a single multi-turn loop antenna for 160metre direction finding contests, before migrating to Australia in 1970.

It was extremely accurate when hand held at ground level. I added a "sense antenna" and was able to head off to the hidden transmitter in the correct direction with complete confidence!

The RF stage is not going to suffer from these problems [assuming the various element voltages are near correct for the device] because the input signal levels are so low. IMD and similar effects occur much later in the chain where the signal levels can easily run into several volts.

I think this is debatable. Intermodulation in the front end by
strong unwanted signals at nearby frequencies can be the major factor
limiting performance. Because most of the selectivity of a receiver
comes from the later stages, these have not yet been eliminated.

Some sets [eg Racal RA17] incorporate an attenuator so that the
overall input signal can be reduced in amplitude in cases where
cross modulation is a problem.

Cheers
Martin

Like other respondents, I have had some limited success in removing
indelible ink from painted surfaces by use of alcohol [ethanol].
I have cases where the removal is not 100% (and the surface of the
paint has been softened, changing its appearence when dry again).
But overall the effect is better than "Return to Sid or face the
consequences" in big blue letters over the case.

Martin

You miss the point<G> The attenuator is placed at the input but the whole point of it is to reduce intermod caused by high signal levels in later stages. The 1st RF stage in an RA17 can handle several volts of input with no IMD/cross-mod problems.

I hate RA17s; having had the job of refurbishing over 300 of the things for the MOD.

2644. Yaesu VX-5R VFO BAND Problem- Pls HELP

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-27 00:00:00 UTC
From: vikramkrishna@iskconbangalore.org
Message-ID: <8qt3ua$1mg$1@nnrp1.deja.com>
Source record: 57623

I am facing a very peculiar problem with my Yaesu VX-5R HT. I have been using it for an year without any problem. Just yesterday, when I put on the power- I am not sure if I pressed the Light or FW Function button by mistake while powering on- the radio had many of its preprogrammed memory stations not being displayed and it would not listen on frequencies like 161.675 mhz VHF which is well within its range. Then I reset the microprocessor by pressing the MR,VFO,4 while powering on. From then, in the VFO mode, it does not allow me to enter any frequency other than the following range - 50-54, 144-148, 430-450 mhz and in all these bands, the band shows NFM. Even if I press the band button, it just shows these 3 ranges- no AM, WFM, or any other ranges within NFM. There is no service centre in India where I stay. Pls let me know if I can try anything before giving up. Any suggestions would be most welcome.

>What would be the group's recommendation for a good
>front-end RF transistor (FET) for a shortwave receiver?
>Overload immunity and good IMD are the primary concerns in
>this case.
>--
>Bill Meacham
>Vieques, PR

It all depends what what your requirements are. A
dual gate mosfet will give you high gain, low noise
and reasonable IMD performance.

The BF961 is cheap to buy and easy to find.

Others: BF981, 3SK88,3SK45, 40673.

A grounded gate J-FET amp will have much less
gain, low noise and will probably have better
IMD performance than than the dual gate FET.

The 2SK125 is a popular choice.

A bipolar UHF power transistor is still hard to
beat. The two popular configurations are:
1
Common emitter with plenty of negative feedback.
See Solid State Design for the Radio Amateur.
This arrangement works very well in the front
end of the Elecraft K2 transceiver. You can
download the schematic from their web site.

2
Common Base with negative feedback to the
emitter via a single turn winding on the
output transformer (Norton Amplifier).

Use a 2N5109 or 2N3866 with a heat-sink
and lots of current.

Thats my opinion for what it's worth. I would go
for the bipolar transistor unless you want the
ultimate in strong signal handling which is
probably a power mosfet. G3SBI published designs
for an ultra linear receiver using a VMP4 mosfet
as the RF amp and four mosfets as a switching
mixer (H-Mode mixer).

Remember that there is little or no advantage
to be gained by building an RF amp that has
a higher output intercept point than the
input intercept of the following mixer.

Source record: 57631

May, 1993 issue of 73 Amateur Radio Today has construction article for building a 12W max in and 200W out amp good with AM-SSB-FM-CW. Good from 7 MHz thru 225 MHz with no tuning or bandswitching. Uses ONE dual MOSFET and fits on a set of circuit boards in a 2"L x 2"W x 1"H project box exclusive of COR and pre-amp.

F.A.R. Circuits had board set [as of 1995] for about eight dollars.

MOSFET cost 154.00 in 1995. Total cost of unit worked out to about 359.00. Interstage transformers are only bottleneck. Company which makes them and sells components for rolling your own would not sell less than five of each or material for making five of each. Cost of them, however was not prohibitively expensive and if you could find four others to build theirs, you'd come out for about 295.00

Hi Bill,
U310/J310 (plastic case) have the best overload/IMD characteristics of any jfet available, but you may have trouble just "sticking" it into your receiver rf amp circuit without rebiassing the jfet. Idss of these are in the 25-35mA range; the device likes a nominal 10-12mA actual bias to achieve those overload/IMD characteristics.

> I'm thinking about a bandpass filter to tone down the BCI. Is the DC
> receiver prone to SW BCI QRM too??

Not necessarily. However the bandpass filter will help. Also a good trick
is to
put a low value resistor (10 to 470 ohm - experiment) across the receiver
antenna connections. This reduces the undesired AM signal much more than
it
reduces the desired signal. Try both techniques in severe cases.

The only reason I suggested getting it back to it's original state
was to see if the replacement transistor was the problem. I even
mentioned the resistors in case someone had changed the biasing
to accomodate the different transistor.

As someone says, the J310 is pretty good, and it's cheap. The U310
as far as I can tell is the same device, but in a metal package.

But as he also said, merely changing the device may not show an improvement, and may make things worse, unless the biasing is changed to deal with the different device.

This is what I was getting at before, when I talked about the evolution of solid-state receivers, and mentioned transistors that were biased at higher current. It wasn't simply that better transistors came along, but that someone pointed out that if you take something like a transmitting transistor, and biased it to handle strong signals, you'd get a stage better able to handle strong signals. You can see the same thing with tubes, because there were receivers that used transmitting tubes in the RF stages.

I suggested seeing if there was a QST review of this receiver because back then, QST often included portions of the circuitry in the reviews, and the front end was something they were interested in showing at that time. I'm picturing 68, 69 or 70, though I may be wrong about when the receiver was available. (I can picture a review of a Lafayette receiver around that time, maybe the HA-650? I do see an ad for one receiver that I was sort of visualizing, the HA-800, which was ham-band only, including 6 meters, and was double conversion and had 3 FETs in the front-end.) I did check my QSTs for those years (which were never complete, and some of the issues from that period weren't with the ones I checked), and found no sign of it. (I did find the review for the Radio Shack DX-150 (March 1968, they said it was prone to overload from local signals) and the DX-150A (September 1970, which says the differences were internal, and shows the RF stage, 2 2SK19s in a cascode configuration). I do see a blurb for the HA-600A in a 1972 magazine, and it physically resembles the HA-800, which is blurbed right below, so I was picturing it right.)

I couldn't find any article in 73/74/75 73 about the Kenwood, but again they aren't all together so I couldn't check every issue. I don't remember such an article at that time, but I do have a vague remembrance of something after the magazine went to the large format, which was in 1976.

For what it's worth, my 1974 HEP replacement guide shows the same replacement for the 2SK19, the 2N3819, and the 2N4416. Probably doesn't mean much, since there were only a few FETs in the HEP line. No sign of a 2SK125.

My ECG replacement guide from about 1990 has no entries for either of the 2SK FETs mentioned, though both the 2Sk121 and 2SK127 are there, and cross to a general purpose, low noise audio amp.

And my Siliconix FET data book from 1977 lists the 2SK19, but shows no equivalent or data.

Again, I suspect there are limits on how great you can make this receiver work, even if you can find a better device for the RF stage and mixer, and bias those stages properly.

I earlier suggested a high pass filter to get rid of the local broadcast station. Since this was a commonly suggestion for strong local signals,

you might ask around to see if anyone has built one and found it useful with that vintage of solid-state receiver.

Michael VE2BVW

Michael,

Hi, and thanks for the long note.

See my comments interspersed...

> The only reason I suggested getting it back to it's original state
> was to see if the replacement transistor was the problem. I even
> mentioned the resistors in case someone had changed the biasing
> to accomodate the different transistor.

Well, having changed the transistor, I can pretty reasonably
say that the replacement unit used originally was indeed
inferior (it was a 2N3819, same as mentioned in your '74
guide). Given the visible lack of craftsmanship and skill
by the person who changed it, I can also safely say that no
other components were changed.

> As someone says, the J310 is pretty good, and it's cheap. The U310

This is why I wanted the 73 article to reference to. I did
as it suggested when I tried it back in the 70s and the mod
was perfect. I wanted to see if I could apply some of the
same rules to this receiver with specific data and component
values.

>
> I suggested seeing if there was a QST review of this receiver because
> back then, QST often included portions of the circuitry in the reviews,

I did see that the HA-800 had a product review, but it is
substantially different than the HA-600(A).

>
> find the review for the Radio Shack DX-150 (March 1968, they said

> the HA-600A in a 1972 magazine, and it physically resembles the HA-800,
> which is blurbed right below, so I was picturing it right.)

I remember listening to the DX-150 in a Radio Shack store
when it came out and it was atrocious in regard to overload
handling. So was the Astro 102BX, so was the Kenwood R599
and countless others in the early 70s. My QTH (and the
store) at that time were about a mile away from 50kw WBT.
One local chap had the folks from Drake come to his shack to
see what was with all his complaints about the TR-7
overloading. So there's no denying that the earliest
vintage solid-state receivers were indeed lacking in this
area of performance, something that was basically cured
within a few years by better transistors, and the better
configurations they offered.

> and cross to a general purpose, low noise audio amp.
>
> And my Siliconix FET data book from 1977 lists the 2SK19, but shows
> no equivalent or data.

I'm working with a '92 SK guide in crossing some of the
options. Basically, my decision is to avoid anything that
was available in the late 60s, early 70s. The 2SK19 went
obsolete for a reason, as did whatever was in my Kenwood
R599. If you recall as I do, the early 70s HEP, etc product
lines were very limited and they were pretty broad in
crossing what few components they offered at the time, so
backwards crossing isn't recommended except for general
purpose repair.

>
> Again, I suspect there are limits on how great you can make this
> receiver work, even if you can find a better device for the RF stage
> and mixer, and bias those stages properly.

This is a 60 dollar receiver on its finest day. I bought it
as non-working for $24. I'm not expecting much, but if a
plastic $10 off-brand chinese walkman can pick up 1480 AM
without it being drowned out by a station on 1370, I'd like
to think this "communications receiver" could also.

>
> I earlier suggested a high pass filter to get rid of the local broadcast
> station. Since this was a commonly suggestion for strong local signals,
> you might ask around to see if anyone has built one and found it useful
> with that vintage of solid-state receiver.

High pass doesn't make much sense unless I'm willing to
disable the BC and LW bands (which I'm not), but a notch
could aid a bit. The receiver isn't particularly well
shielded so that would limit the effectiveness of a notch
filter. And, the next person who owns the rcvr may have
more than one local station (or none) to contend with, so
thats only a stop-gap fix to mask an inherent problem that I
would rather make an attempt to remedy.
>
> Michael VE2BVW

I'm pretty rusty on my solid state techniques being a tube
guy but this experiment needn't be such a challenge. I
haven't gotten very deep into the receiver due to lack of a
schematic...could be there is in fact another ill thats
making it perform so badly. But as long as I'm juggling
mixer/RF transistors, my original posting was to get some
ideas of which numbers are in vogue these days so that I can
order a few of each.

O.K.
Here's the scoop Ron and all,
I was misleading with my first definition- not a squeeze device.
A goniometer does not measure strength, but a dynometer does.
My Occcupational Therapist wife just handed me her goniometer. It is an open ended protractor that does indeed
measure
range of motion. Sort of like a t-square that swivels and indicates the angle. So if you swivel it to
look like a t-square, the indicator will read 90 degrees.
The one I am looking at says "Bacharach Rehab Hospital, Pomona, NJ."
So I know it exists outside the radio world!
Good luck with your recovery. My 15 year old son had his ACL reconstructed last year, so I know
what effort you must do to recover.

2666. Problems With The NE602

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-28 00:00:00 UTC
From: Dan Westin <dwestin27@hotmail.com>
Message-ID: <8r0r6a$gdgju$1@ID-51193.news.cis.dfn.de>
Source record: 57456

I've built a few oscillators around the NE602 and managed to
get the output from pin 7. But so far I have never been able
to get anything from either of the two regular outputs on pins
4 & 5. Can anyone tell me what I am doing wrong? Or what's
wrong with the chip?

Thanks.

2667. Re: SW BCI Problem....DC Receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-28 00:00:00 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <39D407A8.2197649@eznec.com>
Source record: 57457

You've run into one of the common problems of DC receivers. It's generally called "AM demodulation" and is due to poor mixer balance. In a DC receiver, the output from the mixer is audio, which is then amplified with a large amount of gain. If the mixer isn't extremely well balanced, a strong AM signal getting to the mixer will be demodulated, and the audio will be amplified and appear at the output along with the desired signals.

I ran quite a few experiments about 20 years ago and found that the best mixer to use for a DC receiver is a diode ring. "Gilbert cell" mixers (MC1496) can be well balanced, but are sensitive to signal amplitude and source impedance, so don't do nearly as well. I'm sure that the now-popular NE602 is also pretty bad in this application.

Mixer imbalance can be viewed as second order distortion. Third, rather than second, order distortion is a problem in superhets, so you'll seldom find any good data on second order distortion in mixers.

Even with a good mixer and very careful layout, I heard AM breakthrough on my 40 meter rig when listening in Europe. The signals are too strong there even for the diode ring. Here at home, though, it's adequate on 40.

If you don't have a diode ring mixer and don't want to replace yours with one, then the best you can do is sharply limit the incoming signals to the amateur band. This means a narrow filter right at the rig's input. Solid State Design For the Radio Amateur has information on building narrow filters, and you can fine tune a design with something like the ARRL RF Designer software. If there's a single station that bothers you, a notch filter could be made to do the job.

Source record: 57476

For a research project I need, in part, a RF source and an
inverted signal 180 degrees out of phase with the original;
the NE602 seemed liked the quickest and easiest way of doing
this without a lot of additional circuitry.

The book I had found some NE602 circuits in showed various
oscillator designs that could be implemented but never showed
how to get a signal from any of the mixer pins. A frustrating
condition since finding NE602s these days is a lot like
finding hen's teeth.

Actually it is a DE-9 D-subminiature connector.
The second letter is the shell size. Unfortunately the computer jocks have been calling
all D sub-miniature connectors DB for years and it has caught on everywhere else.
The connectors are really DE-9, DA-15, DB-25, DC-37 and DD-50. In many catalogs they now
call DE-9 connectors DB-9 just so that the computer guys will place an order.
Even the manufacturers are now avoiding the use of the letter designation for shell size due to the confusion. Up to the mid 1980's, at least, Ampenol continued to use the letter designation for shell size.
Another thing the computer guys have messed up is megahertz.
It is MHz or Mhz not mhz (millihertz). I often see e-mails where hams a talking about the
14 millihertz band. Which would you prefer... a M$ or a m$. HI HI

From: k7on@earthlink.net
Message-ID: <MPG.143d5ab1525cf0069896b8@news.earthlink.net>
Source record: 57641

I just connected my TripMate to my TinyTrak and it works fine.

Here is how to connect a TripMate, in general.

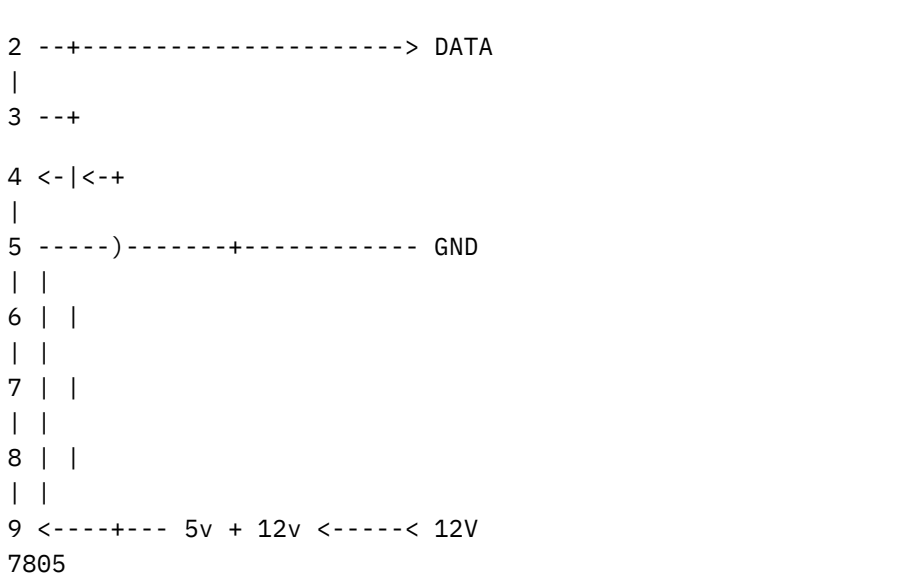
There is likely more than one way to utilize a Tripmate
as a tracker, but below is what I've learned/done so far:

First, open the unit, remove the batteries, pull the plug
connecting the battery pack. Next, install a small jumper
between where the RED wire was and the previously
unused center pin. Close the unit.

Build a regulator using a 3-terminal regulator and a
couple capacitors. The Tripmate can now be powered
via RI pin 9, BUT do NOT connect the 12v directly. I used
an 5v 3-terminal regulator. Connect the regulated power
to pin 9.

Now, connect the regulated output to DTR pin 4. This
activates the Tripmate.

Connect pin 2 and 3 together, so that the Tripmate can
initialize itself.



What I like is that there is no permanent modification to the
Tripmate.

Hope it helps.

I would like to build a radio around an RCA CA3123E chip but have no information on pin connections or application notes. Dose anyone out there have INFO or know where I can obtain it. The usual internet searches have turned up very little.

2675. KG8SU Antenna System / Common Mode intererence

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-28 00:00:00 UTC
From: Curtis Scholl <cscholl@izzy.net>
Message-ID: <39D34886.A56589B5@izzy.net>
Source record: 57643
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur

Hi folks:

A while back I was having trouble with some common mode interference between my antenna system and my neighbors TV's. I wanted to let you all know what finally happened.

I live in an "upscale" (if there is such a thing) mobile home park where the real estate lot is pretty large by mobile home standards. My double wide is nicel placed on the lot and there is plenty of cover tree wise to hide the evidence.

I wanted to use a vertical antenna to keep the real estate being used down and keep the installation as unsightly as possible. It was not a ground plane. The shield of the coax was attached to a 1 foot spike driven into the ground. the center conductor was attached to the base of the vertical. To be sure, I used wire radials spread out over the ground in even angles. 4 radials were being installed.

I was getting a good SWR out of this installation with minimal antenna tuner involvement. I gave out with a shout and sure enough the neighbor lady comes out and says "Somebody's 8 Sugar Uniforms " are being talked about on her TV. OY!

We talked and I called the Media ONE cable company to come check her installation because it is obviously leaking. I don't hear anything in my TV or FM radios and such. They come out and check and say it's not their problem and I must be cranking out BIG wattage. (All of 100 watts from a barefoot HW-101). I put a low pass filter on just in case.

I started tracking wires in our subdivision and sure enough find my ground plane wires are directly over the TV CABLE. After a few experiments with and without the ground wires I came to the conclusion that the ground there just loves to conduct radio waves.

I gave up the vertical and am now using a multielement dipole with elements cut for 30, 20, 15 and 10 meters. No problems at all even at full power. I have to use a tall pole as the center of the inverted V.

I guess I could have still used a vertical with an elevated ground plane, however, I would have had to set the guy wires on my neighbors side of the fence. With the Inverted V dipole I can keep all the wires on my side and parallel with the homes and perpendicular to the street. That way I present as little evidence to the managers eye.

As an aside, there are covenants and agreements that the property owner has made with the township. It is evidenced by the comments that

the Cable TV office had. They said I could not have a "tower" by township rules and made comments like I should not even be using HAM gear near their installations. I don't think they have heard of PRB-1 up here. I don't have a "tower". All I had was vertical. Now I have a dipole.

I will have an invisible beam soon. I mean a wire beam antenna laid out on the roof of the house made of black wire to match the black shingles with a balun painted black. Maybe I will use a phasing circuit that will change the directions of the beam as well.

Where there is a will, there is a way.

Thanks for all of the advise from the last post.

Curtis Scholl

2677. Recommendation for front-end transistor

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-28 00:00:00 UTC
From: stoskopf@tri.NET
Message-ID: <39D36CAB.2AC4870A@tri.net>
Source record: 57645

I threw this question out some time ago and got nil for an answer. All of the transistors are as advertised in the posts, however, I'm still a bit confused on the basics:

Agree that there is no purpose in using a "stronger" transistor than the following mixer,..... Use of a VMP-4 running hundreds of milliamps certainly assures that it will not get out of its "linear" range quickly. But how linear is that linear range? That device has multiple wires to the die and seems to "act" better than some equivalent single bonded devices. But we are discussing strong signal performance.

Then Motorola and others have "Ultralinear" transistors with multiple bonds that seem to be advertised for CATV applications where multiple signals of equivalent strength need to be amplified. Are these more linear than the FET devices?

And again, some of the MRF150 series devices are advertised as having low higher order distortion, but really run a lot of current.

So for my front end, I would like a very linear device at reasonable overload properties (shouldn't have a real big signal there) running a reasonable current. Haven't really seen that comparison in the stuff I read. Most is simply what is available easily.

My mission was to beef up both the front end and mixer of a
garden variety late 60s/early 70s SWL receiver. The main
problem at this QTH is a 5kw AM station about 1/4 mile away.
So while some may struggle for lower noise, others may want
more gain, and others better IMD/Overload performance.
Achieving all three perfectly most likely results in some
degree of compromise, but in the case of a late 60's rig, I
suspect better performance can be achieved in all 3 areas
for about a buck or two.

Source record: 57635

What happened is that the when you set it up you did the "software" mod for out of band. When you reset the microprocessor you "blew away" the mod. I suggest you do the "Hardware" mod..the moving of the solder jumpers in the battery compartment. The instructions are all over the web on how to do it complete with pictures. After you do it, reset it again and it will now go out of band like it used to and won't forget if you do a master reset.

It is...but it wants 6 volts NOT 12. There are adaptor cables for stealing power from a laptop. For all the hassle it is, you might just want to pick up one of those. It takes power from the keyboard or mouse port on the laptop.

I suspect that wouldn't be possible unless you're really
sharp with m/w circuits. The LO would have to be changed as
well as any bandpassing on the in and out. The inputs are
usually pretty broad -maybe the LO could be fudged that far
below its original value, etc, but the end result of all the
tinkering would probably leave it working like a lump of
plastic.

I'm working in the Electronics Industry and have been for 15 years. Yes, we use RS, Electrospeed, Farnell and a dozen other suppliers too. Each of them have their own strengths and weaknesses but Maplin always used to aim themselves squarely at the home constructor and had the necessary infrastructure to support the little guy who just wants a slack handfull of transistors, a bit of Veroboard and a couple of connectors. Even as a commercial user of electronics components, MPS and Maplin often have a better variety of odds and sods than many other suppliers. Often you are not entirely sure what you want, and the opportunity to drive 3 miles down the road to the Southampton store for a 'browse and a look-see' is very useful, but when the store doesn't have an item because it's 'not on our issue list', it's a bit of a pain. Oh yes, they can have it sent out from Southend and you can collect it or have it delivered, but then you don't get a real idea before you commit to purchasing. Sometimes you just want to feel the action on a switch, or look at the texture finish on an enclosure, offer up a PCB to see if it's going to fit or whatever. Yes, RS trade counters help, but it's a palaver....browsing in Maplin stores is better and more satisfying. If only they had the stuff in stock!

Do you really want to build a "switcher"? There are always a lot of Lambda and Harrison supplies on EBay, the shipping is usually more than the final cost, but these would be first class supplies.

You can go to National Semi and Motorola's sites for great switcher designs. For the older (LM257X) IC's Nat Semi has DOS software you can download. For the 258X series they have a very comprehensive windows package. I have built a couple "boost regulator" switchers with the software and I was surprised that the output was very, very clean on my scope. I did, of course, make PCBoards with careful attention to ground planes etc.

If you don't want to wind a transformer you can use multiple IC's, each for its own boost or buck voltage.

Likewise, I use all the "Big Three" - RS, Farnell and Maplin - and
others too, if what I need is one of *their* particular strengths (eg
Electrospeed for connectors and boxes, Electromail for Siemens).

>but Maplin always used to aim

The "Maplin" and "MPS (Maplin Professional Supplies)" operations merged
some time ago. This is good, because it means that amateurs get access
to the same range of components as the professionals. As I said in
RadCom a couple of months ago, Maplin don't have such a wide range of
professional-type components as the other two, but their range extends
over towards consumer electronics - which is sometimes handy - and they
have generally smaller minimum order quantities.

Yep, that just about sums up both the advantages and the frustrations!

A friend once called in Maplin's "Megastore" at Leeds to pick up some
ceramic feedthrough capacitors. He cleaned out their entire standard
allocation... all two of them.

"Eddie Haskell" <harleybum@easyriders.com>
shared these priceless pearls of wisdom:

->The 40673 if I remember correctly was quite fragile to overload. I remember replacing them often.

I've got several tens of thousands of them in the field in the front end of a VHF transceiver(s) operating in high-RF field mobile environments. Other than a couple of infant mortalities (probably as much to do with rug-shuffling on a cold day than anything) once in the circuit and soldered down, they are damn near bulletproof.

I thought RCA was the only vendor on this device. I've got a few hundred of them left in overstock, and was saving them for the ultimate end of life replacement on the transceivers. Is there a currently producing manufacturing source for them (i.e. I'll use them in new designs unless the only stock is the dusty pile of them left from the RCA days)?

I am curious about how radio waves interact with each other in
the real world, not the mathematical one. So I intend to
produce four waves (somewhere in the LF to HF range) 0, 90,
180, and 270 degrees out of phase with each other and see what
happens on an empirical basis.

If I took a field strength meter and did this, would there
really be no reading-- or just reduced energy? Theory says
they cancel, but where does the energy actually *go?*

I also want to see what happens with minor variations that
result in intermediate cancellation that is neither totally
constructive nor destructive say four waves 0, 90, 180, 276
degrees out phase with each other. It's not ground-breaking
research, but there are some aspects of radio wave physics
that no one seems to have given any serious attention to that
intrigues me. Right now I am in "Phase Zero" part of the
research: just putting together the gear.

Hey...I'm using a diode ring double balance mixer. I've solved most of the BCI problem with an RC audio filter that I added but I can still hear some of it and it may interfere with very weak signals. The RC filter seems to be a little noisy too.

Please look at the schematic at http://kd4pwb.homepage.com/hamphotoalbum.html and give some suggestions. Especially I need a suggestion on the output impedance of the 74HC240 chip so I can change the filter.

Regards.

Bill

Roy,

Thanks for taking the time to reply to my question.

I'm using a diode ring double balance mixer. I tried to match the diodes but all I had was an analog volt meter. The diodes (all from the same lot) appeared to all give the same voltage readings.

I added an RC audio filter between the audio preamp and the audio final. This cut out well over 90% of the problem but I can still hear some BCI interference which might interfere with some weak signals. I still may add a bandpass filter along the way. The main problem confronting me now with the project is figuring out the output impedance of the 74HC240 chip. If I can do that I can construct the filter I want. Any help along those lines would be appreciated.

The project schematic is found at http://kd4pwb.homepage.com/n7ksb-sm.jpg .

Thanks for your help!

Bill

I'm unable to access that page. When I go to the URL, I get this
message:

"You are unable to access this file directly because we do
not allow files to be served to other sites. As a courtesy,
we will allow you to retrieve the file by clicking here. . ."

Clicking "here" in the hopes that "they" will extend the courtesy of
letting me view the page brings the message

"Sorry - there's an error.

There is an error with your request.
This function is not available. Please try again."

Not a very friendly site. You might consider getting an account
somewhere else if you want others to be able to look at your web site.
Out of curiosity, what purpose could be served by a web site that
doesn't "allow files to be served to other sites"?

2696. Duroid or Teflon PC board

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-29 00:00:00 UTC
From: Harold Johnson <w4zcb@ispchannel.com>
Message-ID: <1D7B5.3863$HO3.467356@news1.onlynews.com>
Source record: 57497

Anyone out there have a small piece of either? I need to make some capacitors and am willing to purchase large pieces (willing to purchase the small pieces too!) if I can determine that it will do the job. What I need is a square inch of either or both to measure the pF per square inch and determine if I can stand the area.

Anybody tried a BFY90 as a bipolar frontend? It was a good 'small-
signal' work-horse for wideband CATV amplifier 1st stages.

Note that beefier 2N3866, although often used in early wideband CATV
transistor amplifiers, was NOT designed for class-A operation. It is a
multiple-emitter device WITHOUT ballast resistors, and is essentially a
class-C device, relying on skin effect to share the emitter currents
equally. Class-A operation, at fairly high currents, caused certain
problems as the transistor aged. Later CATV transistors (2N5109?) were
specifically designed for ultra-linear class-A.

Ian.

2698. WTB: (or Trade) Large-Digit Nixie Tubes & Sockets

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-09-29 00:00:00 UTC
From: afranzman@aol.compute.com
Message-ID: <20000929183642.20227.00000490@ng-cg1.aol.com>
Source record: 57499

Wanted, to Buy or Trade:

(Sorry if this isn't quite on-topic. There don't seem to be any newsgroups exactly fitting this subject.)

Large-digit "Nixie" type neon numeric digital display tubes, especially those with digits over 1 inch (25mm) tall. Also, sockets for same.

Most wanted: Burroughs type B-7031 or B-7032 "Jumbo" size - 2 inch (50mm) tall digits in a tube 5.5 inches (140mm) tall by 2.25 inches (57mm) diameter at the base. And the large 14-pin sockets which fit them, type SK-117 or equivalent, having a pin circle diameter of 1.75 inches (45mm).

Actually, I have 5 of the very rare B-7032's, which are the inverted display configuration variation of the B-7031 (pins on top pointing UP when digits are upright). Mine are slightly to moderately darkened; however, due to anode location in these tubes, the darkening is mainly on the sides of the glass and does not significantly affect digit appearance when viewed from the front. All have been tested and function perfectly when driven in the 10-16mA range per preliminary B-7031 data which can be seen here: http://www.wps.com/archives/tube-datasheets/Datasheets/Burroughs-catalog-918A/index.html Will consider trading my B-7032's if I can get more and/or better condition B-7031's in the deal.

I also have available to trade, "Super" size Nixies of types B-6091 / NL-8423 (a.k.a. NL-5423, and interchangable with earlier types B-7153, B-6033, and BD-206). These have digits .808 inch (20mm) tall, in end-viewed configuration. In addition, I have Philips (Mullard) type ZM1040 which have digits 30mm (1.18 inches) tall and a red filter coating on the glass. I have sockets which fit both of these tube types, equivalent to HSK-112, HSK-106, B13B, and VH13/131.

Does anyone in southern California happen to have any of the HUMONGOUS Nixies with ***6 INCH TALL DIGITS***, type CD47/GR414 Rodan Indicator Tube by Okaya Electric Industries Co. Ltd. of Japan? Picture here: http://www.netcomuk.co.uk/~wwl/count.html Even if you're not willing to part with one, I'd love to just see one in operation. I can even build and bring a breadboard driver circuit if you don't have one.

Replies by email please. See below for a clue to repair my email address. 73.

Alan "A.J." Franzman

My real e-mail address does not compute.

Why measure? You know the dielectric constant of the board (wel-
specified for stuff like this) and you know how thick it is.
The rest is standard capacitor stuff. All the usual references.

I've done this in reverse - measure the capacitance of a piece
of cheap surplus stuff to determine its dielectric constant.

> wrong with the chip?

The NE602 is a mixer/oscillator chip, and pins 4 and 5 are its mixer outputs. The 602's circuitry is designed so that its RF input (pins 1 and 2) and oscillator signals "balance out" and are greatly attenuated (by several tens of decibels) at the output of the mixer section. Only the arithmetic sums and differences of these signals (and, at lower levels, the sums and differences of their harmonics) should appear at pins 4 and 5.

My mistake. I apologize. I made the mistake of simply clicking on the link in your posting. When I looked at the postings again, I discovered that somewhere along the line, a carriage return got inserted in the posted URL. So I was taken to http://kd4pwb.homepage.com/n7ksb when I clicked the link, where I got that response. Going to the correct URL of http://kd4pwb.homepage.com/n7ksb-sm.jpg, I do see the schematic.

All I can suggest to improve AM demodulation immunity is to check and make sure the LO signal coming from the IC is large enough to switch the diodes on and off hard. (In some of my designs I've used a low output Z follower producing a few volts p-p, applied to the mixer through a 51 ohm series resistor.) Also make sure the LO signal is symmetrical.

> wrong with the chip?
>
> Thanks.

But what are you trying to do?

The NE602 is primarily a mixer, of the "Gilbert Cell" variety, with a
simple on-board oscillator.

The oscillator is nothing more than a single transistor, if I remember
correctly. It's intended for use with the mixer, and any use of
the device as only an oscillator is only incidental.

I think pin 7 is the emitter of the transistor used in the oscillator.

Pins 4&5 are the outputs of the mixer. Since it's a double balanced
mixer, there will be little or no output unless there is a signal
on the inputs of the mixer, pins 1 & 2. A double balanced mixer
will not let the signals on the inputs feedthrough to the output
(though this is for the ideal mixer, in reality, there is likely
to be a little feedthrough).

I don't see much advantage in using the NE602 as simply an oscillator;
if you just need such a thing, you might as well use a transistor or
two. I suppose one could get the oscillator signal to appear on
the outputs of the mixer by unbalancing the mixer with some DC voltage,
but without the data sheet, I couldn't suggest exactly how.

Message-ID: <lbbbts8j09r4d089sv0mrjq1725skujgnf@4ax.com>
Source record: 57509

I have a NiCd battery pack for a ham radio that died from lack of attention. It was 7.2 v 1500 mAh. I cracked it open and found 6 cells approx AA size. I'm going to try replacing the 6 cells with AA NiMH 1550 mAh batteries because full replacement battery is expensive.

In the existing pack there are 2 gadgets in series with the cells. One is a little metal can labeled PEPI N. On the web I verified that it is a thermal protector. The other gadget is thin square about .5 in on a side. It has blue plastic tape on the outside. Peeling that back it sort of looks like a capacitor -- metal plates sandwiching a thin black layer -- but it isn't. Measuring it shows about 1 ohm with no polarity, so I think it is a resistor.

Anybody know if I am right on the identity of this second thing? Why is it there? In my rebuild I'm currently planning to recycle these two devices into the new package. Any comments on what I'm up to?

thanks,
Rex

You can always give the NiCads a high current momentary "shot" to wake them up.

Sometimes you will find an inline fuse in the battery pack.

The main manufacturers - and makers of the Duroid brand - are Rogers,
and they have full technical data (including a downloadable calculator)
at http://www.rogers-corp.com/

There's lots of Duroid about at hamfests, sometimes at ridiculously low
prices. The clue is that you can bend it - you then say: "This PC board
is no good - it's soft!" (as in: "This blackcurrant jam tastes of
fish!").

From: Jeff James <jeff@eclipse.net>
Message-ID: <39D5FA38.AB9A8673@eclipse.net>
Source record: 57547

Hi all,
Just received an Eimac Jan 4-400A from a reputable dealer..comparing the

old Eimac with the new -two observations: There is no etched serial
number on the shroud inside the tube; and the tube feels lighter with
smaller "fins"..The date code on the box is 1984.
Any thoughts?
Thanks,
Jeff W2NBC

The square thing might be a current-lmiting device, one of those "poly"
self-resetting fuses?

Did you investigate www.primecell.com ? They rebuild battery packs just like
the one you are describing. You can probably look it up by Mfg and part
number and see what they charge to rebuild it. They claim to test all the
cells and replace only the ones that need it.

Be careful about changing from NiCd to NiMH as they don't charge the same.
Do you have something that will charge the pack in NiMH mode?

I have no connection with Primecell except as a satisfied customer.

>So I know it exists outside the radio world!

There's another place, too. A goniometer is used by people measuring the reflectance properties of materials (e.g. paint). To completely characterize how a surface reflects light, you need to know how much light is reflected for all possible combinations of the angle of incoming light and outgoing light. This is done by rotating any two of the three objects involved (light source, sample, detector) through a range of angles. The device used to hold them is called a goniometer.

Richard,

Thanks for the reply.

I have decided that the square thing is a polyfuse. Seems like a real good thing to keep. I found a vendor that will supply the whole internal cell pack at a reasonable price, but still more than individual AA cells. I'm going to continue with this rebuild since I have the cells on hand. BTW, replacing just some of the cells seems like false economy to me. They could easily be out of balance and lead to other problems soon.

Yes, I do have a new NiMH/NiCd charger that I can use.

-Rex

2734. new use for old analog phones??????

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-01 00:00:00 UTC
From: feralmet@bendigo.net
Message-ID: <39d717e5.582891@news.netcon.net.au>
Source record: 57562

Dear Scroungers

Is there anyone out there who plunders parts or assemblies from old analog phones and puts them to use?

The old handbag size phones have some particularly juicy bits in them.

I have managed to fire up the IF strips, mic preamps etc, but I don't understand how the phone works as a whole and how the logic circuit enables squelch, audio etc. I don't understand how the frequency synthesizer works.

QUESTIONS:

Are there any web sites with really detailed stuff like circuits etc.?

Can the transmitter "gain blocks" be used for other frequencies, like 2 metres for example, or even HF ?

..... THANKS .... happy homebrewing possums

Chris Shaw (soon to be a licensed amateur)

>analog phones and puts them to use?

Old cordless phones are a good source of parts.
FM receiver chips, I.F. filters, A.F. amp, crystals,
PLL chips, transistors........

The 12.88 or 14.4MHz high stability oscillator modules
from cellular phones are very useful.

Scrap CB radios are another good source.

Doesn't the use of agc mean that the signal at the later stages is
controlled to an appropriate amplitude (and, also, by the time it reaches
later stages, interfering signals away from the desired frequency will
also have been attenuated by the slectivity of the tuned circuits and/or IFT's?
[eg with a big enough agc voltage, the valves will actually attenuate,
rather than amplify]

Isn't it quite possible to have volts of interfering signal at the
grid of the 1st rf stage? [eg with transmitters operating relatively
nearby]?

Hope you can help my understanding improve.

Cheers,
Martin

The 1st RF stage in an RA17 can handle several volts of

Where you might find such is an old set of 'walkman'
headphones. I've seen 'em for sale separately at places
like Digi-key. If you strike out, let me know...I have a
few old headphones around here and would have to cannibalise
one to see the exact dimensions.

: Thanks in advance,
: John

John,

Often it means the new tube was placed in a circuit where it's operation
was measured in some way. A value was placed on the measurement and
tubes with similar values are paired off to be sold in sets. Actual tube
operating values and conditions can vary quite a bit, even in the same
production run.

Sorry, wrong "homebrew" group. As the newsgroup title (and article content) indicates, this group discusses amateur radio equipment and techniques, not beer making. We call homebuilt equipment "homebrew". A number of readers are also brewers of beer and ale, and I'm sure one of them can steer you to the appropriate group -- or even tell you where to find a brew kettle.

I am looking for a Commodore video monitor, model 1702 in good
working order,near or around the San Antonio, Tex. area.
If you have one or know where one may be 'had' at a
reasonable cost, would appreciate your input. Thank you for your time.

When you are working with at straight key, you don't know what kind of voltages that are on the key terminals, or the polarity. With older keyers you were also isolated from the specifics of the keying voltages because they used relays to actually key the transmitter. With newer keyers, with solid state output, it matters.

The most common connection is where the center of the key jack is a positive voltage and is expected to be grounded to key the transmitter. This is not always the case.

Some manufacturers isolate the outside ring of the key jack and swap the polarity of the voltages. Others use a negative voltage. And still others use a voltage that is expected to be sourced through the key and complete the circuit from the key jack's tip and ring.

You need to drag out the manual for the TS 140S and the keyer to see what they say about the keying. A keyer is usually capable of taking care of all the different kind of keying with internal jumpers.

Not being familiar with a rig that new....With the rig in CW and manually placed in XMIT does the rig put out RF when the paddle is closed (dot or dash)? If not the keyer is not providing the GND (I assume a GND) to the key line...if this works... Is the VOX turned on? If none of this works Is the keyer compatible to your rig, what does the key line require...what does the keyer provide...the manuals for each should tell you this. If your rig requires a Gnd on the key line and your keyer is designed to provide a voltage...OOOPS opposing voltages don't mix.

Merrill Skolnik wrote the "Introduction to radar systems" which is kind of a tutorial on the concepts and techniques in radar.

Introduction to Radar Systems, 2nd ed. (1980); and Merrill I. Skolnik (ed.), Radar Handbook, 2nd ed. (1990), a comprehensive reference work written for radar engineers, covering the various aspects of radar technology. S.S. Swords, Technical History of the Beginnings of Radar (1986), surveys the developments prior to World War II, focusing on early European achievements. Henry E. Guerlac, Radar in World War II, 2 vol. (1987), is an excellent, authoritative history written by a professional historian with a background in science. Merrill I. Skolnik (ed.), Radar Applications (1988), is a collection of technical papers describing the various applications of radar, such as air traffic control, military air defense, aircraft and spacecraft surveillance, and remote sensing of the environment. David K. Barton, Modern Radar System Analysis (1988), provides a fine technical presentation of many aspects of radar design. (M.I.S.)

I purchased my copy about 10 years back and it was rather pricey then but it is well worth the bucks. His math is not overly intensive but calculus definitely helps. Check out a college library for a copy to see if it is something you want to buy.

By the way, the pulse from your system at 1 KW is going to make you very popular with the neighbors. :-)

Hello, Steve--

Building a radar set capable of detecting aircraft will require a considerable investment of time and effort (and money). And, you'll have great difficulty in getting it approved for operation by whatever is analogous to the FCC in the United Kingdom.

If you're interested in breaking new ground, you might investigate the phenomenon of signal interference and reinforcement. This occurs when signals from a distant transmitter arrive at your QTH via two paths--direct, and reflected off an aircraft. You can see this effect in a TV image when the TV image shows a ghosted image whose amplitude fluctuates over a few seconds.

If the direct and reflected signals are in phase, their amplitudes add; out-of-phase signals cancel.

In effect, you're seeing a not-so-hot form of "passive radar", but you might explore using directional antennas pointed toward several TV stations and multiple receivers. Tap the receivers' AGC lines, and feed the voltages into a "vector processor" box that extracts direction and magnitude from the input information (a nontrivial task). The math would get tricky, but you might be able to work out a crude triangulation scheme. IIRC< "New Scientist" or "Wireless World" magazine ran a brief article on the topic some years ago. This is at worst a theoretical exercise, and at best a learning experience<g>.

Have fun!

I salvaged a realy nice 45 to 10.7Mhz IF with FM detector assembly
from an old OKI cell phone, all in a sealed can with only 5
connections. I have also salvaged 44.545 Mhz crystals for use in 45Mhz
to 455 Khz mixers. Pill power fets and 900 Mhz power amp IC's can also
be found.
The older the phone the more usable the components. The newer phones
are all SMD with ASIC chips that are hard to remove and reuse as well
as being to specalised.
My favouries have been OKI and Novatel.
Unfortunitly power amps are only usable at the frequency ranges their
designed for. But there is ATV activity at 916Mhz.

Each one you open is an adventure.

Thanks, Michael. What was I was trying to convey was that the RF stage was the least likely stage to suffer from cross-mod. One of the most "bomb proof" Rx I ever used was an old Atlas job with no rf stage at all. Signal went through a BPF and straight into a diode ring mixer. That thing could handle anything you threw at it.

I agree that some RX designs have used power fets and such things in the 1st stage. The only things of this type that I have been involved in the design of were to be used co-sited with high power TX systems. That is a completely different ball game from what is found in most domestic use.

Check http://www.net4you.co.at/user/kuneth/info.html

You will discover that it is easy to achieve pretty good results
in detecting airplanes with ham equipments.

You can play with CW Doppler Radar technics by listening to the
carrier of an VHF/UHF TV TX through a SSB receiver and a spectrogram
software like FFTDSP from AF9Y.

Best results are achieved when listening to a TX with weak direct signal.
Then, the level of the signal reflected by the airplane can be higher
than direct signal.

I have tried it a few years ago with a FRG9600 receiver connected
to my computer and a vertical antenna. Great resuls by listening to
TV TX around 800 MHz. Airplane doppler shift is about a few hundreds Hz.
I also achieved some airplane detection by listening to 144 MHz
ham beacons (10W) and 1296 MHz beacons.

I am confident that is is possible to locate the airplanes by
listening to several TV TX. The doppler shift will be different
for each transmitter and I assume that one can compute the
airplane position with this information, or at least the direction
of velocity vector.

Have a lot of fun with Amateur Radar !

Pin 3 is the "Base DC bias voltage" Vbb.
The Vbb absolute maximum rating is 6Volts.
All examples in the Mitsubishi 1989 databook use a 5Volt Vbb.

I have a train of 12VDC clock pulses which are used to control external 230VAC mains powered timing equipment. When the power fails the 230VAC equipment will not operate but the 12VDC pulses continue with Xtal and battery backup. I need the pulses to be accumulated while the power is down so when the power is restored the pulses can be restored to advance the 230VAC equipment back to where it should be. (I do not need to know how many pulses occurred while the power is down so long as all the missed pulses are restored later)

how can I do this?

Jim,

I just installed the Hustler 4 BTV at ground level, works great, no radials
needed and it was cheap as far as verticals go. AES and HRO both have it
around $120
It covers full band on 40, 20, 15 and 10 with 1.8:1 VSWR across the bands.
The secret is the mounting, I first used a 5 foot painted TV mast, SWR was
all over the place. Reason, BAD GROUNDING... So I went to a plumbing store
and bought a 4 foot section of 1 1/4" galvanized pipe, drove it in until
only 18" was sticking out of the ground, reset the vertical to the
dimensions on the spec sheet, PERFECT!

Bryan KS4HR in Appomattox County, VA

Need two IDENTICAL roller inductors about 20 uH maximum. #14-16 or so wire size ok as they will probably be used at 100 Watt or less power level. They will be used in a balanced antenna tuner and must be the same.

Agreed that seldom do you need an RF stage at HF, but if you do, and if you stay in the "Linear" operating point of a device, how do you know how linear the "Linear" range us? Surely there must be some distortion with any device, even though it is no measurable or is meaningless. Splitting hairs.

>All examples in the Mitsubishi 1989 databook use a 5Volt Vbb.

manufacturers mainly interested in showing maximum RF output
performance, and people think it is sort of an unwritten law not to
vary this voltage, but Philips shows some curves for different voltage
for the BGY43 (2m). Although the bias voltage range is different, it
might interest to tell that power output could be varied 0.1-14W -
with .2W drive

Hi. You do not really need a switcher, even at these high power levels.
You could get away with a 60 hz transformer based supply if you are willing
to have a large (and hot) unit. To keep the cost down, you may still have
to do a bit of transformer winding, but it will be non-critical.

I have 5 of the type M68729 class C (i.e. FM) 30 Watts out average, 40 Watts max. These will replace older M57774 module just fine. The input drive is 300 mW for 30 watts out. I am asking $50.00 including shipping to conus for each of them them. RF parts wants around $70.00 for the same.
I will sell them all for $200, this is the equivalent of getting one for free.

These are brand new never been used and still have the one inch leads on them. I have 4 of them in a sealed rack and one loose.

Thank You,

Bryan Fields, KB9MCI

The recipe for a big linear power supply is as it has
always been: a great big transformer, a big bridge rectifier,
a big capacitor and a big voltage regulator (e.g. an army of
2N3055s). Have a look at, say, Solid State Design for the
Radio Amateur, or the power supplies chapter in Horowitz
and Hill.

The transformer is typically the hard part - everything
else is off the shelf. Why not see if you can find something
suitable first? The usual design rule is that if you can
lift the transformer, it's not big enough. :-)

You might also want to gain experience by building a smaller
power supply first. My 5 amp bench power supply, for example,
consists of a surplus transformer and bridge rectifier,
a couple of hefty electrolytic capacitors and a 5 amp
TO-220 voltage regulator bolted to a hamfest heatsink.
A resistor and LED provide both a pilot light and a bleeder
resistor for the umpteen-thousand uF. Butt-ugly, but it
works like a charm!

> Any thoughts?

Dunno unless the JAN tube is the same as their 'shop' tubes - they
usually don't have the polished ring around the outside bottom.
BTW, this ring and that shroud you mentioned make up a partial
screen bypass cap, so be sure the ring around the bottom is grounded
with a clip of some sort.

I've had some interesting Eimac tubes - one 4-125-A that got
so hot it melted the plate seal glass and the plate leaned
over and touched the screen...but it was still "hard" and
the filament lit up. Another 4-250-A had a fingerprint
burned into the plate. Great tubes - I used to have the
entire triode collection from the 3C24 to the 2000T...gone
now.

Count the pulses (Digital).

You can do this a lot of different ways depending on just how many you expect to
count total.
A few can be a single chip counter.
More might be a good application for a PIC.
A LOT might be a 68HC11 etc.

How fast can the catch up pulses be?
Milliseconds. microseconds, nanoseconds?

Radars have to be FCC licensed and frequency assigned to prevent interference to other radars. An illegal one that was causing interference would receive prompt action from the FCC. They react very quickly when they receive a call from the FAA.

I haven't. However, Ulrich Rohde had an article in QST in 1980 or 81,
with something about making crystal filters. There was a BASIC program
for determining the values for crystal-lattice filters, and he included
a chart of some sample results. I don't think it said much about making
filters, but I do remember that one of the chart entries was for
something like 41MHz. So if you can track down the article easily,
it might be worth looking at.

In his receiver articles in Ham Radio about receivers, he mentioned
once or twice roofing filters. At least once, he showed a schematic
for a crystal filter that he said was better suited for such frequencies,
but the text really didn't say much, and it sure wasn't practical information.

This isn't technical, but last year I was reading a book out of the
library,
"The Invention That Changed the World:How a Small Group of Radar
Pioneers Launched a Revolution" by Robert Buderi
It gave an interesting overview of the development of radar, from
shortly before the WWII. And after the war, it goes into how much that
development impacted on other facets of radio and electronics.

It wasn't technical, but unlike some books on technical topics intended
for the general population, I didn't notice obvious errors.

Of course, it talks about the work done at MIT, and of course, the
Radiation Lab there put out a series of books that in part covered
radar, which must be dated in terms of the technology to implement

radar, but must deal with the basics in a still useful fashion.

I can't quite picture what's going on in this case, but using dividers
to generate quadrature signals is not a new thing.

Certainly, it appeared in amateur publications almost as soon as logic
ICs became available to the hobbyists. A lot of it was theoretical,
ie "one can even generate the quadrature signal by using dividers",
in articles about using the phasing system to generate SSB. You can
do it with two type-D flip-flops, which I recall had some limitations,
and of course, the signal fed into it is divided by two. Far more
common is another configuration where the output signal is
divided by four.

Back in 1973 or 74, there was an article in Ham Radio about a phasing
type direct conversion receiver, using MC1496's as product detectors,
and ECL to generate the 90 degree apart local oscillator signals. The same
author followed it up a year or so later, with a matching transmitter.
That may have been the first practical article in the ham press.

In more recent years, the idea may have become more visible, since
phasing has made somewhat of a comeback, with better ability to match
components (or perhaps better components?) and even with the use of
doing the audio phase shifting in digital.

Both my 1986 and 1993 Handbooks (the most recent I have) include the
details of using dividers to generate quadrature RF signals for phasing.
It's even in "Solid State Design for the Radio Amateur" by Wes Hayward
and Doug DeMaw published in 1977.

Don Lancaster even shows the circuit in his "CMOS Cookbook", though he's not talking about phasing SSB.

I can picture an article in QEX a few years back about a Weaver/third method SSB transmitter, and I can picture some sort of counter like the 74HC161 being used to generate the needed phase-shifted signals.

The problem isn't that amplifier stages won't overload, but that mixers
will overload first. An amplifier only has to amplify.
But a mixer is mixing, and is by it's function more prone to overload
than a straight amplifier.

I'm not going to use units, just numbers. Lets say there is a 1 level
at the input to the first amplifier, and it provides a gain of 10. Assuming
it doesn't overload, it's output will be 10. So the mixer that follows

is seeing ten times what the amplifier saw at its input. And the mixer is easier to overload, so it suffers from that and the fact that the signal is amplified in the amplifier. Take out the amplifier, and the mixer can handle stronger signals at the antenna, but of course has to deal with the lack of amplification that might be helpful on weaker signals.

Concern about the amplifier overloading is only a problem if the mixer can handle the signal out of the amplifier. If that mixer can handle that 10 level, then you can start wondering if the amplifier will overload on strong signals.

Another way to look at it is that if the amplifier after the antenna is overloading, you can be reasonably sure that the mixer is overloading also, at least in simple receivers.

If you put an attenuator between the antenna and the amplifier stage, yes, you are reducing the signal level that the amplifier sees at it's input. But if you reduce the signal that the amplifier sees by 1/2, the output of the amplifier will be only at level 5 for the same level 1 at the antenna, and the mixer may be better able to handle that.

I don't know where AGC fits into this, but certainly you do want selectivity as close to the front-end as possible. That's why you should put a good filter right after the mixer, so the following stages do not have to handle more than the bandwidth that the signal occupies. You do see amplifiers before crystal filters, in receivers that are using diode-ring mixers, but the amplifiers are intended to deal with strong signals without overloading, by use of proper devices and proper biasing. You need that amplifier there in that case, because of the losses in the mixer. But you want as little amplification as possible before whatever is used to provide ultimate selectivity, something that wasn't always the case in receivers of days gone by. And whereas at one time you would have significant gain before the mixer, some of those old tube receivers had two stages of RF amplification, you now want as little amplification before the mixer as possible.

The ideal receiver would put all the selectivity between the antenna and the first stage. But there are problems with that, which of course is why we have superheterodyne receivers.

A friend of mine got his PhD in EE with a dissertation on using the TV reflection effects as a basis for a system for tracking aircraft when active radar could not be used. I do not know the title of his dissertation, but the work was done at the University of Texas in the late 50's. The author is Bert Henry.

Re an active radar, I wonder if there are regulation issues regarding this mode of operation with an ordinary amateur license?

Re Maplin's low stock levels, I sometimes use the branches in Liverpool and Grimsby and was told by one of the managers some time ago that they've no got so many shops that if they stocked components in any depth, they'd have more out in the shops than at their warehouse. This really makes Maplin untenable as a shop service for components, so I tend to use other component suppliers by 'phone who don't charge Maplins high P&P. EG Grandata, Viewcom and ESR are just three who charge about a quid P&P. They have wider stock ranges of discrete components at generally significant lower prices.

I wonder how long it will be before Maplin go down the same path as Tandy?

That's what comes of a one-time hobbyist supplier who tried to compete with the likes of RS and Farnell, not helped by the decline in electronics and radio with the onset of the "plug 'n play mentality" which has become the norm.

Regards,

David.

Good Morning Gents. For whatever reason, I have not been able to send a corrective post these last several days. My ISP has been extremely uncooperative.

The answer is that it can't. Thank you Martin for catching me and I apologize for the confusion I generated. I had built the Bedford radio and used the Tayloe detector for the DC conversion. I used the 161 for a simple squarer, and fed that to the Tayloe PISC 3253 which DOES make the quadrature output. I spoke off the top of my head without reviewing the circuitry. Sorry about that, and let's see if this miserable ISP lets my mea culpa onto the newsgroup.

Hello Harold,

You know I wondered if that might be the explanation. I built the
version in (SPRAT Vol101 G0BBL) in surface mount. It's tiny but with a
terrific performance.

I have not tried or even seen reviews on the 2 specific antennas that
you mention. But I know just enough about antenna theory to be
dangerous so I am going to throw out a few thoughts for your
consideration.

1. Get an ARRL antenna handbook and read the sections of it that are
pertinent to the type of operation you do. This one simple action will
go a long way to help you understand why your signal is what it is on
the air.

2. When I talk to other hams, their vertical antennas often do not live
up to their expectations. Verticals seem more suceptible to vagaries of
poor local terrain than wire or beam antennas (which can be raised
above the terrain where the vertical almost always has to be mounted on
the ground).

3. Radials are the "other half" of a vertical antenna. A poor radial
installation lowers antenna resistance and therefore efficiency. Many
watts into the antenna yields just a few radiated watts. A " no-radial"
vertical must be bending the rules and paying the price, I think.

4. My guess is that "no-radial" verticals use some form of a
counterpoise to capacitively couple to the ground. How well this
actually works, I can't say. But it flies in the face of the lttle
theory that I know and I am suspicious.

Caveat emptor. If I was you, I would go carefully before actually
spending any money.
Good luck.

You should be able to find non-plated enameled copper wire. A coil wound with this will have as high, or higher, Q than a coil wound with silver plated wire. Pure silver is only 6% more conductive than copper at DC, and 3% at RF. But plating is rarely pure silver. Typically it's an alloy with conductivity considerably less than that of copper.

Well they did, didn't they. They were taken over by Altai.

Rumour is Altai, in its turn, has been swallowed by someone else.

Local retailers here are having difficulty getting bits and pieces
from them as well. (We are lucky in having a local shop which sells
run-of-the-mill components - and surplus).

Russ let me know by email that his application is replacement of roller inductor windings. In that case, more than raw conductivity is important, because of the moving contact. I'm not really an expert regarding high current contacts, but don't think plain copper is generally used in this application, so I'd stick with silver in this case. I hope anyone with information about obtaining silver plated wire will help him out.

One solution might be Kool-Amp. They sell powdered silver you can rub on yourself. However, I think their minimum quantity is a bit large for most amateur uses, and I don't know how durable the coating would be in an application like a roller inductor.

AFAIK They (Maplin) were the subject of a management buyout subsequent
to the takeover. I guess, judging by their Grimsby shop (which I visit
anonymously), that they're trying to be like a catalogue shop, as Argos.
The store has got me out of trouble once or twice so I won't knock them,
but I have mixed views about the service.

Tandy UK were sold to a mobile phone chain. (See the Scunthorpe branch
for details :-)

2809. Rig mods (for Europe)

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-04 00:00:00 UTC
From: LA8AK@online.no
Message-ID: <39dba84e.457040311@news.online.no>
Source record: 57541

have written some line to provide my personel opinion about
modifications for some available rigs

Rig mods or salvageing components (by LA8AK):

Nokia, see http://oh3tr.ele.tut.fi/english/modifications.html

Salora SRP24C xtal controlled, one xtal per channel, otherwise similar
to SRP25C
Salora SRP25C 2m, very good rig for packet radio, provided some
modifications are done
Salora SRP25D 70cm, very good rig for packet radio, provided som
modifications are done
(solid state +9V switching and antenna-switching)
Storno CQF612 2m, very large, has room for repeater logic, may have
230VAC psu
Storno CQM612 ufb for 2m repeaters and packet, easy to install 230VAC
power supply
Storno CQP612 ufb for 2m packet radio, max 12 xtal channels,
complicated battery supply,
easy to modify for -30VDC supply, need solidstate
voltage switching
PYE W15FM - only the 10m version seems worth modifying for use. The
rig needs many
modifications to avoid spurious, 2m version should have
power module instead
of original power supply
PYE Europa 4 and 2m versions. Only for salvaging parts, MD952 coax
relay - may pass 450W
PYE T100MN has QQE06/40 in output stage, but not practical for 2m PA
PYE T30FM a very good TX, but large (19" rack mount), and needs
several modification
PYE R18FM RX for T30FM, (19" rack mount), needs some modifications
to perform well
PYE R17FM older RX, was replaced by R18FM
PYE AM10d has a 12V/300V inverter (QQE03/12)- may be useful for use
with other surplus
rigs
PYE AM25B Vanguard - mainly valve functions (QQE03/20), was popular
30 years ago in UK
PYE AM25T Vanguard - Valves in TX (QQE03/20), transistors in RX
PYE F60FM transceiver (QQE06/40), has a power transformer -
suitable for 200-500W 2m PA
most PYE equipment is available for many bands.
AP2000 70cm version is often unstable, helix filter may cause

problems for mobile
and repeaters, particularly if temperature goes down
below zero

If you have a thick skin and know how to talk tough, you can
post this on rec.radio.amateur.antenna. Eventually, you should
get some pretty good advice.

Steve,
In a nutshell, find a used marine boat radar in x band at about the 10 to 12 kw pulse level. A fair price for such a unit here in america is about $400 to $500. The 'cheese box' antenna does a nice job of finding aircraft, more so when you don't really want to see them. hehehe bless!

If you tried e-mailing me, sorry but the Toronto Freenet was having
problems which are now fixed.

As for the items you can check out the 6 lists at
http://www3.sympatico.ca/metaphors/sale1.htm

A friend has set up a web site for me to sell off a 28 year accumulation
of electronic components including:

Coaxial Power switch,
RF power and other transistors, RF I.C.'s,
Minicircuits mixers, ceramic 455kHz and 460kHz filters,

variable capacitors, both panel mount shaft type and trimmer
variable inductors and coil forms, RF feedthrough and standoff capacitors,

High voltage: VACUUM RELAYS, RECTIFIERS, resistors and capacitors,

Other capacitors including, Photoflash, polypropylenes, tantulums,

Switches, such as foot switches and industrial limit (micro) switches,

Ferrites cores, Transformers and inductors,

Transistors for power audio amplifiers and television deflection,
Super fast (35ns) 1 and 3 amp rectifiers, and lots, lots more.

Ralph,

I have the Q signals for international amateur radio ("phone") nets and also QN for CW nets. Here are a few I found, but there are no exact matches to your question.

QRU Have you anything for me?
QNK Transmit message for ..... to .....
QNU The net has traffic for you. Stand by.

Hope these help, for more see the ARRL pages devoted to nets or look up ARES. The above information was taken from form FSD-218 (2/91) published by ARRL HQ, Newington, CT. I was never privileged to operate much army comm. in the days I spent on the air, most of our traffic was on local net and no real messages were passed, it was mostly convoy work and two-way comm. between a couple of stations. Never was in a real army "net". 73 de Mike (KB5HXT)

> Can someone help please?
> GW4BCF
==========
To give a sensible reply to your question , it is necessary to know the
range of your sat-rx.
Suppose this is 920 to 2150 MHz eg the span is 2150 - 950 = 1200 MHz.

With an LNB having an Local Oscillator of 9.500 GHz ,the rx range wil be
10.42 to 11.62 GHz
To receive a higher freqency you'll need a second LNB with a higher LO
frequency ,a practical value being 11.475 GHz ,which will permit a maximum
rx frequency of 13.625 GHz .

A LNB with a LO higher than 9.500 GHz can be used to receive the lower rx
frequencies by
inserting a low cost converter between LNB and SAT-RX ,which provides an
additional offset (I believe 500 MHz).
These converters were made available when the later ASTRA 1 sats came into
operation ,such that receiving the then 'new' frequencies was made possible
with the older LNBs .

Some SAT-TV LNBs can be converted for use on 10 GHz ATV.
Two interesting and very comprehensive articles on this topic by PE1PUW
,PA3GCO and PE1MMI have been published in "ELECTRON" ,April 2000 ,
pages 140 through 147 , the magazine of VERON ,the Dutch IARU affiliated
society.

Jim,

I have been using a Cushcraft R7 vertical antenna for almost 10 years. It does use counterpoise radials (a group of 7 stainless steel wires sticking out from the base). No, it doesn't work as well as a beam, but I have worked DXCC with it and for the price, it is a super performer. I swear by it more than at it! The R7 isn't made any more, but has been replaced by the R8 which does 6-40 meters.

AES sells the R8 for $400.00. More information about this antenna can be found at http://www.cushcraft.com/amateur/r8.htm

2818. Re: pulse accumulator

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-05 00:00:00 UTC
From: arm@helix.nih.gov
Message-ID: <8rhssp$po41@icet.net.nih.gov>
Source record: 57398

There are a number of possible methods. Some questions, first.
1) How long of a power failure are you designing for?
2) How rapidly can you deliver pulses after the failure to
catch up?
3) Can you afford to miss one pulse?
4) I assume these pulses are at 50 Hz.

Without any further thought, I would be tempted to throw
a cheap microprocessor at the problem. To save power,
the micro can run in the shut-down mode until a pulse
arrives. It then counts the pulse and goes back to
sleep. The micro's own clock can be used for the timing.
Upon power restart, the micro then delivers the
missing pulses to the existing timing circuit.
You could probably do the whole job with a 8 pin
micro and a few parts.

On the other extreme, you might try this. During
the power failure, use the pulses to drive
either a capacitor or an op-amp integrator.
When the power comes back up, discharge the
cap with a constant current load circuit.
While the capacitor is discharging, the
voltage across the cap goes to the reset
line of a 555 timer. The 555 timer runs
until the cap discharges.

The input is easy, if it's doable at all: either use the
image response, or modify the DRO puck, or replace the puck
outright.

The output is problematic. The original output frequency
range includes our 23 cm band. It does not include our
13 cm band.

There was a good article on the subject in VHF Communications
a couple of years ago.

If I may reiterate: find a transformer before you do anything
else. The size, shape and exact ratings of the transformer will
determine most of the rest of the supply. Since they are
expensive new, it's worth scrounging - but that means you won't
know what you're using until you've bought it.

Three terminal regulators are handy, but are not a panacea
for power supply issues. Especially if you consider the price
of 4 TO-3 LM338s (more expensive than the TO-220 version, but
better thermal capability) and compare it with other options.

This is well covered in all the usual references.

If you have to count a lot of pulses remember that you can reset the counter at, say 2^15 pulses, and each time the counter resets you increment another counter - i.e. like keeping a logarithm's mantissa and characteristic.

Yes, IDENTICAL power transformers can have their secondaries connected in parallel to increase current and in series to increase voltage.

This is the same concept as many power transformers sold today which have a pair of identical primaries and secondaries. The primaries can be connected in parallel for 115V and in series for 230V.

Likewise the secondaries can be connected parallel for 1x the voltage and 2x the current, or in series for 2x the voltage and 1x the current.

Hi,

The MC3356 is a wideband FSK receiving chip. Do not seem to
be able to locate any. (to be used for spectrum analyzer)

Well, I found a great application note at the National semi website
about paralleling the output of LM338s (with kelvin sensing to boot).
Couple of extra resistors, and 338s, and I've got a well-regulated 20
Linear PS. All that's left is the building - a mere trifle ;-0

==========
Has anybody exerience with silver plating by means of a solution of silver
cyanide and potassium cyanide.
Application is by rubbing copper wire with liquid soaked cotton swab.
I know it is poisonous stuff and extreme care is to be taken ,but would it
be effective ?

TIA for info

I had never seen that one before...

Several options occur to me:

1. Obtain a set of reasonably similar candidate transformers
and try it and see. There is no substitute for hands-on
experience.

2. Consult standard references, like the power supply discussion
in Solid State Design for the Radio Amateur. They discuss this
exact issue and present a design based on three transformers
in parallel.

3. Find somebody local who can assist you. There are all kinds
of interesting and useful things you can do with the Internet,
but this isn't one of them.

4. Consider another project. If you don't have the background
to solve this problem, you should consider something smaller
and simpler to figure out how stuff works. There are lots
of far better first projects.

I do just that in my 3500V 1A supply. I have two "identical" 120 VAC primary transformers that deliver the correct secondary voltage but 1/2 the desired current.

I series-connect the primaries for 240 VAC input and separately bridge-rectify the secondaries and use a common filter choke/capacitor.

I could not find any with three transformers in parallel, but on page 163 there is a design with three 6.3 V filament transformer secondaries in series producing 18.9 V. The primaries are of course in parallel.

Big power transformers are sometimes connected in parallel by using an inductor with a centre tap, which is connected to the load and the ends of the inductor go to the hot ends of each transformer secondary.

Email: feedback@tapegerm.com

Sonic Organism Infects Web

Salt Lake City, Utah - A new sonic organism, Tapegerm, is infecting the world wide web. In only 4 short months, Tapegerm has grown to include 20 diverse artists and been featured on the main page of FranceMP3.com. A musical collective of 20 artists, Tapegerm creates original music using loops and sounds contributed by fellow Tapegerm members and visitors to their web site. Tapegerm is a cohesive, but somehow anarchic collective focused exclusively on crafting collaborated music entirely in cyberspace.

Tapegerm began as an experiment with re-mixing hometaper music at homemademusic.com and quickly evolved to embrace and infect the Web. Like a living organism, there is no central organization, no founder, the membership is continually evolving and each member is equally important to the life of the whole. Tapegerm artists create 'Germs", musical loops that spread, multiply, and mutate, and assemble them into musical collages. Available on the internet, the music runs the gamut of electronic genres, from ambient electronic to techno to noise to experimental.

Internet based reconstructive music is in the embryotic stages of becoming a long lasting artform and Tapegerm is at the forefront of this movement. We've all seen what the mp3 format has done to change the world of music, but we've only begun to see the potential that the internet affords to creative individuals who are banded together in ideas, but separated by geographies. A sonic organism such as Tapegerm exemplifies the democracy and "creative frontier" hype that the internet has been billed as being, but often falls short of.

Visit tapegerm.com for a look at the group's progress, listen to new mixes happening nearly daily, upload your own sounds for the group to manipulate and employ in new recordings, and get hold of three exceptional CD's exploding from the combined creativity of 20 artists.

It looks like we can use pulse transmissions in bands above 1GHz but
with a peak power of no more than 400W. Now that's got me thinking
what I can do with an old 400W microwave oven as we have a band up at
2450MHz.
>

It sounds like the receiver is listening at the same time as the
transmitter is transmitting - perhaps the TX and RX signals are
'mixed' - the resulting frequency would be directly proportional to
range?

>
>A more important question would be: Detect aircraft at what range and with
>what resolution in position?

No real accuracy required but it needs to show something is there. Say
to work from 1,000 to 40,000+ feet with a range accuracy within about
25%, position accuracy say within +/- 20 degrees.

Agreed:
Or in Canada, and other Commonwealth countries, for example! Or, Japan or China, or in Europe or in ..... etc. Although we are very happy to live next door to our US neighbours we are also very happy that some of our laws are different!
With radio waves etc. of course there has to be international 'co-operation', as in Europe and world wide. This doesn't mean, however, that one country just copies the legislation of another country!
From Eastern Canada.

Strange, every MWO I have ever taken apart uses a magnetron. Usually they produce 750W or so in CW mode, but would probably produce many kW if connected to a proper pulse modulator.

In the USA there are some microwave ham bands where pulse transmission is allowed. You could build a radar on one of those bands. In fact I remember a QST article from back in the 60's where someone did just that.

Barring that, there are other types of radar. You could FM a 10 GHz gunnplexer using a square pulse. It would have limited range but would still work. (Pulsed mode is not allowed on 10 GHz in the USA). The company I work for makes an Fm radar that is swept with a ramp, then processed with a FFT (I don't know the details since that is in another department).

A more important question would be: Detect aircraft at what range and with what resolution in position?

Well, I finally did it. I signed up for the 50K Club! You can too.
It's only $10 in PayPal money, so I said "What the heck!"

This is brand new, and all you need to do is sign up 10 people who sign up 10 people, etc. If you can do that then you should have $50,000 in your PayPal account before it's all over.Yes,I said FIFTY THOUSAND DOLLARS!

Start now, and whatever you earn is put directly into your PayPal account by your downline. Nobody receives money ahead of you. Someone joins, and five minutes later it's in your account! It's unreal!! Fill your checkbook!! No more building downlines for someone else. What you earn you get! You are thinking maybe you have seen a program like this one before?? You haven't!! There hasn't been one like this before. What makes this Club different is that it works!

Guaranteed!!You start getting paid with your first sign-up. Plus, every sign-up and every payment is verified so no one can cheat or short-change the system! YOU WILL GET PAID! How much money you make is up to you! Need $10,000 in the next 10 days?

You can have it if you get going immediately! You must take a look at this and get started NOW! Take control TODAY!

This is brand new, so join RIGHT AWAY. You don't want your friends, neighbors or family to join under someone else, do you?

If you don't already have a PayPal account, you will need one. You can apply for one and not only is it FREE to set up, they even PAY YOU $5.00 for opening a new account. I'll send you the necessary info!

As I start looking, I discovered the very problem you discuss.
Question: Can the output of identical transformers be connected in
parallel to increase current capability?

Finding two really identical transformers may be a problem.

However, using separate rectifiers for each transformer feeding a
common capacitor will isolate the transformers from each other.

Source record: 57433

To all,

The following link will show photos taken in the back of the rental van, prior to partial disassembly for transportation via my Chevy Lumina van, which made it a "Low-rider Chevy".

http://www.eht.com/oldradio/k2tqn/1940-xmtr/sept-2000.html

I now have it inside my storage area, awaiting a full restoration. Mostly it is a little dusty and some minor mold on the power supply dropping resistors.

At a local ham club meeting this week I picked up additional B&W final coils for 80 and 40-m - for the 212 P-P amp. The only one that came with it was a 20-m.

The builder was August (Gus) Greber, W2JPV, a SK since the 60's. Does anybody remember him?
---Here's what I already know---

August A. Greber, W2JPV

During the years 1946 through about 1956 he lived at:
104 Fairmount, Hackensack (This is when I believe he built the transmitter and later updated it with the new units.)

During the years 1959 through 1963 he lived at:
E. 220 Midland Ave, Paramus. (This is when I believe he may have been winding down on his ham radio career. They were found in the attic. His station was in an attic room.

In the year 1981 he is not listed in the ham radio call book as W2JPV. So I assume he was no longer licensed at this time. [He may have died around 1966.]

> for a 500 watt average power.

The only unknown is what the cathode can handle during the pulse. It may
be that the pulse power is limited by cathode current. Of course to get
that
high cathode current you need to use high voltage which may also
be a problem.

400 to 600 watts is probably all you need for short range anyway.

2852. What logic family should I stock?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-07 00:00:00 UTC
From: Peter Nelson <plnelson@mediaone.net>
Message-ID: <pUJD5.35319$pu4.3843645@typhoon.ne.mediaone.net>
Source record: 57435

I want to have a better stocked "junkbox" for
homebrew and short-notice projects - not
necessarily just ham or RF, but all kinds of stuff.

I'd like to settle on one main logic family to
simplify organizing and storage. I'm trying to
decide between cd4000-series logic and
74CH/74HCT devices.

The 4000-series accepts a wide supply voltage
so it's great for battery-power (I can just slap
a 9V battery on it) but it's slow and has a limited
range of functions. 74HC/HCT is way faster
and has more availaible functions but it's fussier about
supply voltage so requires a voltage regulator and
the lowest quiescent current regulator I've seen
is 15 uA which is still WAY more than a many CMOS
circuits. With many circuits I like to skip a power
switch and just replace a 9V alkaline once a year.

Some people have suggested I skip discrete logic
altogether and go to FPGA's or PIC's. The FPGA's
I've seen are current hogs compared to discrete
CMOS and have expensive development environments.
Moreover it seems like overkill to use a $15-20 FPGA to
replace 2 or 3 or 4 CMOS IC's that cost 35 cents apiece.

I looked at PICs a year or so ago and at that time they
had expensive development environments (The ICE's
I looked at were $1500+) and most of their programming
environments did not work in NT, which is the OS I
use. Should I revisit PICs - have things improved
since then?

Thanks in advance for any opinions.

I doubt if you could get a whole lot more peak power out of an oven microwave
than you can average power. They would arc if you tried to sqeeze them to hard.
Seems like I remeber someone doing tropo-scatter with one of these mounted on a
parabolic antenna.

usually 'dead-bug' mounting arrangement for RF works much better than
a nice looking circuit board designed by an audio engineer...

tried to check up available information for different types of RF
power modules, but it seems impossible to find all the data needed for
many.

Philips shows an almost complete circuit diagram for the BGY36 and
BGY43 modules, bias current for the first stage is fed from supply for
output stage, while it is not quite certain what Motorola do, complete
circuit diagram is only shown for MHW401 - which doesn't seem to be an
ordinary module for me

Hello Jim,

FM [0r CW] radar is very old and there are some quite old text books
on the topic. I first came across it at Weapons Research Establishment
in South Australia back in the 50s. A bloke I knew had two 3cm
antennas mounted on the wings of an aircraft and could get height
forward velocity and drift info back on VALVE operated equipment. No
semicons in those days. They also buit a unit for the WRE exhibition,
which could track people, Great fun. These days they use spread
spectrum as well, but you need to be conversant with it's technology
to build one.

Greetings All:

I am wondering if anyone out there has a PSpice model for a triode tube, such as a 572B?

I am working on a tuned input for an amplifier, but I feel that the simulations are not quite correct without the model included.

If anyone has one or knows where I can find it please let me know. Reply directly to n3yyp@arrl.net as well as the news group.

Thank you,

At 400W from a microwave generator is ok for heating a sandwich, but as the tubes in al the M/W's I have seen are KLYSTRONS. They are not designed to be pulsed as are MAGNETRONS,. So I believe that at 400W you would need one real serious receiver to detect the echo from a plane.

I am looking for a good antenna to be able to work the LEO birds, I do not have AZ/EL control because I do not have a rotar, I place the antennas on my roof in a fixed position..

I am wondering if anybody else does this and has any decent designs...

If so could you please reply to this post and leave an address for them...

Why do you want to build a linear supply (I came in late)? Switchers can be made to run clean. They will save you the transformer heartache and expense. Check out December 1998 QST it has a nice paint by numbers 40 amp switcher.

73,
Joe

Greetings!

I am looking for info (schematics, specs, anything) on the "Pace Communicator MX" it is a crystal controlled 2 meter handheld. The one I have has a 9 Volt battery clip for power, but intuition tells me that was a mod.

Any and all help will be appreciated?

Thanks and 73,
Joe, ka0yos

I agree with Bob - never saw or even heard of a klystron in a microwave oven. They are really unsuited to that service and would be far too expensive.

Since the m/w maggies can do at least 500 watts average power output in continuous service for up to the better part of an hour at a time, they should be good for many kw of peak power in pulsed service. for example, a 1 usec pulse with a rep rate of 1000 pps (1000 usec interval) works out to be a duty ratio of 1/1000 for a peak pulse power of 500,000 watts for a 500 watt average power.

Not too shabby . . .

As I used to tell the radar classes I taught for many years at Texas Instruments, there are far more magnetrons in service today than were ever thought of in WWII.

Hi,

There are a number of people in the UK using a form of parasitic radar to track aircraft. The trick is to use the returns from an existing primary radar and to synchronise your plot with its scanner's rotation. Obviously you need to be close enough in to the radar to be able to detect when the transmitter fires; after which you will need an omni-directional hi-gain antenna (a contradiction in terms) and a good receiver blanked for a short period just after the pulse. None of this has been shown to be beyond the bounds of ham ingenuity but don't expect the same received range as the main radar as you won't be able to match their antenna gain.

And, just a passing thought - it might be that the PRF and rotational speeds of certain primary radars are locked to some easily available (such as the mains) or other derived frequency. In which case, you may not need to be able to receive the primary pulse but just to find the aircraft returns from an existing radar and work out the exact PRF and rotational speed from them.

As for microwave oven-based radar (2,450MHz), I think that 'Bluetooth' will be operating around there and you wouldn't want to that unpopular!

Cheers - Joe

Agreed. Throwing something together does not refer to dead-bug construction, it refers to the way some people believe a simple circuit will always work. Too often a simple circuit is not repeatable due to the spread in component characteristics. And when a simple circuit does not work where do you start? Very messy for the inexperienced.

> 74CH/74HCT devices.

As you said, 4000 series = low speed and low power consumption.
74xx = higher speed but needs more power.

There is such a wide range of devices available that it would be difficult to stock them all. Keep a stock of simple logic gates, counters, buffers, etc... 4001, 4011, 74HC4040, 74HC00, 74HC04...

If you really must stick with one logic family, the HC and HCT devices are a good compromise between speed and power.

> their programming environments did not work in NT, which is the OS I
> use. Should I revisit PICs - have things improved since then?

You don't need to spend all that money. I recently moved my PIC development from Dos/Windows to Linux. I use the Gpasm assembler, Gpsim simulator, and Picprog programming software with a homebrew JDM type serial port programmer. Gpsim is incredibly fast. On my PII 333MHz, simulations run at more than twice the speed of a PIC84 with a 4MHz clock.
You can expect to spend somewhere between 5 and 20$ on the parts for a homebrew programmer.

I haven't tried using MPLAB. I'm told it is very good but that the simulator is a bit slow. I think the newer versions will run on Windows NT and Windows 2000. Check out: http://www.microchip.com for details.

No - it's the other way around. The UK distributor Farnell bought
Newark. However, they haven't merged their catalogs, so don't expect to
be able to buy BUD cabinets in the UK (or flat-pin 13A mains plugs in
the USA) anytime soon.

Buy something surplus. Get to rallies and car boot sales (hamfests and
flea markets), ask friends who know where electronic equipment is being
scrapped... and keep looking until you find something.

Actually, if you have already started to build the amplifier, it may be
too late. Once you start to set detailed requirements for dimensions,
your chances of happening on a cabinet of just the right size, shape and
price go down sharply.

The alternative is to make your own, and get the basic parts cut and
bent at a local sheet metal firm. There's been an article on building a
PA in recent RadComs which shows how the various panels and flanges
might be laid out. If you're inexperienced in sheet metalwork design,
you might follow the example of the person who developed the prototype
chassis and cabinet in cardboard (Bristol board) to get the dimensions
exactly right.

Hi Ian!

Thanks for the reply.

I've looked at the recent rallies around here and nothing suitable found :(
The next rally I will be at will be Picketts Lock, so hopefully I may stumble
across something.

The local sheet metal place to me doesn't want to know as they will only do bulk
jobs,
I only want a few sheets bent to size :(

I've been reading the article in Radcom and have found it most useful ...

I've not started on the amp yet, i have almost all of the parts and ideas on
layout
but nothing is fixed in "concrete" yet as it all depends on case size etc etc
...

Cheers!

Actually, British flat-pin mains plugs are fairly common in the surplus
house bins here in the Minneapolis, MN area. I won't swear that they are
13A, however, as I have not been very interested in them.

Neither. Invest in a good CPLD/FPGA package. Xilinx offers a $99 version of their package. You can get reasonably priced CPLDs (9500 family), and their Spartan FPGA family for more advanced designs.

Other than for repair, discrete logic is dead.

I have built a NorCal 40 QRP rig and to extend the freq a 49pf NPO cap is called for.

Could one of you experts please tell me what does the NPO cap designator mean.

I feel silly since I have been a ham for 40+ years and maybe my age is catching up with me. The answer is probably so simple it has just avoided me possible non-polarized??? if so but the "O" has me stumped.

Thank all of you in advance.

I don't know what the actual letters stand for either, come
to think of it. I understand it to be a cap with zero
temperature coefficient.. NPO is usually applied to ceramic
disc designations...a silvered mica or polystyrene should
work just as well. Just don't use a garden variety Radio
Shark item.

Agreed. Interesting that you mentioned this. Isn't it sort of the
conflict we see between all the simple American solutions where we
know it is needed somewhat more to it to get it working... like simple
zenerdiode screengrid regulator for a power amplifier, and anode
supply with very few components....
Seems to be a conflict between Europe and America on this, or perhaps
the simple -unsufficient - 'designs' catch more interest?

see http://www.ifwtech.com/g3sek for information about proper supplies
for tetrodes as well as triode linear amplifiers.

While it seems to be important notes for VHF, isn't TX intermodulation
a worse problem for HF ...?

NP0 means zero temperature coefficient. Actually stands for
negative-positive-zero. A cap with a negative temp coefficient would
be designated Nxxx, where xxx is the coefficient in parts per million
per degree C. Conversely, a cap with a positive temp coefficient
would be designated Pxxx.

Must be old age. hihi I have been a ham only 27 years and have a beter memory. The NPO means Negative, Positive, Zero. Only had to look up what the 0 was.

You probably remember the caps as temperature compensating ones used for VFOs and may have a marking of n750 or P 750. That means the value will change 750 parts per million per deg of temp change. The NPO means it will not change with temperature. Use these mostly for the tuned circuits in later stages or to get the VFO in the general frequency range.

Several people have told what NP0 stands for, but not why the unusual name. I believe that NP0 capacitors were made by laminating a piece of positive temperature coefficient ceramic with a piece of negative temperature coefficient ceramic for a net near-zero temperature coefficient. I don't believe they're still made this way.

The more modern EIA designation for NP0 capcitors is C0, which means zero nominal temperature coefficient. It's followed by another letter to indicate the tolerance, with C0G (+/- 30 ppm/deg C) being the most common.

It's a matter of how the ceramic slurry is mixed before the ceramic die (in some cases, sheet) is fired.

Different formulations will yield different temp comp characteristics (among others). Ceramic capacitor formulations are a sort of dark art, there are a lot of quirks to it.

Ceramic capacitor manufacturing is the last place you'll find alchemists these days. ;~)

Find a line-of-sight chart and that will pretty much tell
you the range. It's staggering! The actual output power is
almost irrelevant unless you want broadcast quality.
Consider that they've gotten pix back from Mars and Jupiter
flights with only a handful of wattage.

Great idea! You can mount 813s horizontally but the plate
must be in a certain plane because the filament can sag and
short internally. I don't recall which direction is
correct.

Why would one even consider pulse radar when CW radar will work well
and give a lot less problems with the law. Spread Spectrum can do even
better since it can be made invisible by burying the transmitted
signal in the ambient noise. Process gain retrieves the reflected
signal from the ambient noise.

Because all of the large switching plans I've found require transformer winding (usually big, and lots of 'em), and that's more than this mewly minted Tech is willing to bite off, right now. Once I find the transformers (and I think I'm on the trail), I'll have a very nice space heater, errr, power supply. Except for the trivial building part.

>> the transmitter and antenna? Rob Mockan.

Yes, I still have a copy of the article around here somewhere too.
It was not so much radio waves that it was transmitting, more like
transmitting electrical signals through the earth.
The circuit is quite simple. If you think of the ground as a big
mesh of resistors all of roughly equal value then transmitting a
signal across the mesh is not so hard.
The antenna (as it could be thought of) is two stakes in the ground
as far apart as phyiscally possible and perpendicular to the
dirrection of transmission. (same for the recieving end.)

All that is left to do is connect your 500W audio amplifier to the
two stakes. At the recieving end have a high impedance amplifier
connected to the stakes (say, the phono input of aother pre-amp ?).

It is possible to get a few miles out of a basic system. I don't know
how far you could go with a good setup.

We have been using 10mW and 2.4GHz vido here in the UK for amateur rocketry - got to about 2000ft with a handled 11 turn helix on the RX end.

450mW and 900Mhz should get you much further.

How about Agilent Technologies (used to be Hewlett-Packard). I'm
sure they have something that would do what you want (and then some).
For instance, the 8648D does 9kHz to 4000MHz in 0.001Hz steps,
residual phase noise is around -105dBc/Hz.

I'll half-way second Chris's motion. In commercial designs
I do, I'm much more apt to use a CPLD or FPGA or simple
processor (e.g. PIC) than discrete logic, PROVIDED that
there's enough logic to warrant it. On the other hand, it's
kind of silly to put in a couple dollars worth of parts if
a simple 30 cent part will do the job. For hobby stuff, an
advantage...a big advantage...of programmable logic is the
ease of making changes. In fact, you could make (or have made
for you) some "general purpose" boards that accomodate CPLDs
in a variety of densities (36, 72, 108, 144, ... macrocells),
and have a relatively "instant" solution to a lot of problems.
Xilinx does have web-based tools you can use at no cost,
but you have to put in a text-based design description, not
a schematic, and that may be daunting. The $99 software is
capable, but takes quite a lot of hard drive space. If you're
on an older machine with a small hard drive, it could be a
problem. The cheap software used to even come with a
programming pod, but I don't believe it does any longer. The
docs show a schematic, which isn't complicated. BTW,
shop around for the $99 price. DigiKey and some others seem
to want much more than that for it. I believe the Xilinx web
site has links to vendors.

As for logic family, I'd personally opt for 74AC parts, which are
fast and spec'd to operate over a range of voltages...not so
broad a range as 4000 series, but still useful for interfacing
with both 5V and 3.3V logic. Oh...the Xilinx XC9500XL parts run
on 3.3V but accomodate 5V input levels and output "TTL" levels.

Actel is also worth checking out for CPLD and FPGA parts and
support software.

I recently mentioned a product called "Kool-Amp", a silver powder which could be applied to other metals for silver plating. I had the name wrong; the product is actually Cool-Amp. Anyone who's interested can get more information about it at http://www.thomasregister.com/olc/cool-amp/home.htm. I haven't ever used the product, but a web search showed what looked like a number of comments from people who had.

I have used Cool Amp for about 35-40 years. The first pound I bought was $10, the last was $43 and that was at least 10 years back. Good stuff, if you wish to plate copper or brass (or overcoat silver for some reason) making a paste about the consistency of toothpaste by adding a bit of water and rubbing it on the surface. This yields a nice thin coat of pure silver. Due to the abrasive polishing action, it is quite handsome.

Electric utilities have used the stuff for years to "re-plate" switch bar and relay contacts to make them run cooler due to reduced I^2 R losses. I have plated wire, copper pennies for grandchildren, cavities and even copper chassis plates for old 2-meter 416-B amplifiers. Most recently, has been the plating of physically small, heavily loaded copper pipe helical resonators for the 100 MHz region. Careful measurement of before and after "Q"'s of these have occasionally yielded lower Q after plating than before. I don't really believe that it really lowered it, but as Roy has implied, it's darned difficult to measure any improvement that's above the noise of a fair home workshop environment.

A pound (minimum quantity sold the last time I purchased any) will last pretty close to a lifetime. I have bought 2 pounds since 1960, still have about a half pound and have given away at least half of it. Be very careful of it, it's hydroscopic and will, given the opportunity, take moisture from the air and make a brick the shape of the inside of the jar. If the chap who wanted to short circuit the commercial purchase would send me an E-mail, I'fd be happy to send enough for the job. However, unless you're really into the learning experience, I was at the Ten-Tec hamfest last weekend, and saw their roller inductors (silver wire and all) being made. They sell these all by their lonesomes, you don't have to buy the rest of the tuner, and that aproach would probably leave you the time to do something else much more constructive and/or educational.

Then I have to set up a Linux system. I actually
do have a Linux (Caldera OL 2.3) system on my
LAN - I run Samba on it and use it as a file and print server.

But I don't run any apps or do sw development on it because
it's too hard to find supported apps. The Linux support model
tends to depend on the whims of newsgroup posters which
I have not found to be adequate in the case of Linux or its apps.

Assuming my OS of choice is NT, how hard is it to set
up a affordable PIC development environment? (anyone)

In flying 450Mhz transmitters running one watt, results of 350 miles plus at 100,000 feet is not uncommon using preamps on recieve. Black and White cameras do tend to be seen farther. Monitors will drop to Black and White when they no longer can decode the burst. Black and White cameras are also cheaper and easier on the pocketbook especially if you do not recover your balloon package or recovering a damage one.

Email Address Is Below !

Brand New ASTEC:
VS3-K0-K2-K3-00
Single Phase 85 - 264 VAC /// 47- 440Hz Input
Three terminals for output:
one 2v @ 150amps
two 5v @ 150amps
three 12v @ 62.5 amps - For Ham & CB Gear

Detailed Specifications On Power Supply:
http://www.astec.com/products/1150.astec.pdf
(Must have Adobe Acrobat installed to view)

This page show a different model for sale:
http://www.newark.com/
Search for "manufacturer" part number and enter "VS3"
for other models then use the PDF (Adobe) specification
chart to compare output watts / amps.

One example is a VS3-C6-C6-20
which is VS3 or 5x8x11 case
Terminal one is "C6" which is 28v @ 32.1amps
Terminal two is "C6" which is 28v @ 32.1amps
The unit on that page is about $2,000

I'm selling this for $120 UPS Shipped

Yes, cases that size are always expensive. Unless you find a surplus
item with a good case you might have to build one from aluminium sheet
and narrow aluminium angle stock. The raw materials are quite
inexpensive....

if you are powering the circuit from a mains operated transformer, set
the 555 to run very very slightly less than 50 hz, and grab some of the
a.c. that goes to your low voltage rectifiers, pass the a.c. through
a high value of resistor (apprx 10k to perhaps 100k) to the junction
of your capacitor resistor ladder on the 555. Presto! Sync!

Yikes, I meant to say, set the 555 to run very slightly less than
100hz, the A.C. from your power transformer secondary will kick the
555 into locking up at 100hz.

2927. Re: Homebrew 70cm Antenna

Source record: 57393
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.homebrew

K50E's web site contains quite explicit instructions on making
eggbeaters. I made a 2 meter one before I discovered K5OE's web site
by following the ARRL Antenna Handbook. I basically downsized their
loop design for HF. It had the advantage over K5OE's design in that it
didn't require 93 ohm coax. A quarter wave section of 75 ohm line
provided a matching transformer from the 100 ohm feedpoint to the 50
ohm coax. A quarter wave of coax is a lot easier to measure at 7 MHz
than at 146 MHz but it worked.

Anyhow, I run 60w SSB and 30w CW into the antenna and can get quite
good signals into RS13, FO29, and FO20 at ranges out to 2500 KM or so.

Good luck,
Tom

Actually I don't need a RF signal generator (with modulation
capabilities and other functions...), but just a frequency synthesizer
that will drive the LO input of a mixer, in a RF front-end.

Hi out there,
I have been given a Kenwood R2000 that has an
apparent logic problem. The holdup battery is fine but when the set is
turned on the freq. display just shows zeroes and when I attempt to
select a band an alarm signal sounds through the speaker. I have
checked all the oscillators for output and they all seem to be
working....I thought it might be an out of lock problem,. If anyone
has a circuit or manual they could scan or any advice is greatly
appreciated.

I recently (a couple of weeks ago) bought a couple from Barend
Hendriksen. Possibly for the same project. :-)

While the chips are obsolete, they are only just barely so:
the date code on the devices is 9950.

The Radio,Computer & Electronics Show takes place on Sunday 15th October at
THE NEWPORT CENTRE, NEWPORT, Sth WALES just 1 mile off junc`s 26 or
25a M4.

The show opens at 11.00am

Many new and all the regular traders attending, plus specialist groups
including
the R A with their test gear, bring and buy, refreshments and BAR.

Want to sell that radio/computer gear or W H Y, too much for the bring and
buy then hire a table.

Contact FIREHAM@AOL.COM now to book or for more info.

Traders ring 07970 777756 now.

Come to NEWPORT the GATEWAY of WALES.

Hi I am making a simple electronic project and I fear I may have wired it wrong. Is there a way to test the different parts to see if some are burned out? I see RS sells different kinds of meters, but I am not sure which one I may need. The parts I would need to test are a few small resistors,transistors and capacitors. Thanx for any suggestions. Tim

You can get a multi-meter at Radio Shack that will be very
useful as you learn. But in this case, if the resistor
isn't visibly burnt-its probably ok...likewise with the
capacitors if you haven't exceeded the voltage rating. As
for the transistors, well???, a simple replacement might be
easiest and cheapest.

> > Xilinx offers a $99 version of their package.
> > You can get reasonably priced CPLDs (9500 family),
> > and their Spartan FPGA family for more advanced
> > designs.

I think maybe some posts in this thread got lost but I'm
still unclear on a couple of things:

1. When I look at the Xilinx data sheets for their FPGA's the
current consumption is measured in MILLIamps, not the low
MICROamps I'm used to with many of my CMOS
discrete logic circuits. I don't clock my devices very high
so their current drain is almost as low in real life as the
databook suggests. I like to replace batteries maybe
one or twice a year. Are there lower power FPGA's I
should be looking at?

2. I'm still unclear on what I need for a development environment
for FPGA's/CPLD's. With discrete logic I need a breadboard plus
the usual instruments ('scope, meter, logic probe, power supply).

For FPGA's/CPLD's, in addition to the above I know I need some kind
of a hardware device to physically program the chip, plus some
kind of software to simulate and design and control the above
hardware. But I'm unclear what, if anything, will work with NT.
(the issue will be the interface to the programmer, not the sw)
and what it would cost, assuming I buy the gear commercially.
What do I need to get started on this in NT?

Also, what's the learning curve like and how should I
get started?

> > Other than for repair, discrete logic is dead

That might be true for me depending on the answers to 1 and 2, above.
Thanks for any further information!

---peter

PS - to Tom: I'm also peter_nelson@agilent.com (I'm a sw
engineer, otherwise I would already know the answers to all this!)

Excellent Idea Chuck. With a tower one can even mount the Larger tubes vertically as they were intended and a Desktop case would be a handsome case for 4CX250's and Such.. And you can find used towers everywhere including the curb side on trash day. Dude!! You're da MAN!

For what it's worth, there was an article in Electronics Illustrated
for September 1961 (I knew I'd seen this article, but it magically
appeared since this thread started) entitled "Terraquaphone". It's
just an audio amplifier (tranistorized, the author is listed as
being with Motorola Semiconductor Products) with a transmit/receive
switch, and two rods driven into the ground. Transmitting or receiving
depends on wether the T/R switch connects the output of input of
the amplifier to the rods. At the other end, you have a similar unit.

"In general, the signal probes should be parallel to each other. The spacing
of each pair is determined by the distance between the two Terraqhaphones.
The farther apart they are, the greater the range. Other things being
equal, usable two-way communications usually is possible over
a distance 30 to 50 times the probe spacing. A spacing of 30 feet then
would mean a 1,500 foot range." It mentions that signal strength
diminishes
as the squre of the distance between the two units. It also mentions
very briefly that the same scheme will work in water. They list the
probes as being 1/2" by 18" copper, steel or aluminum pointed rods.
Soil affects propagation.

I thought this sort of thing was described in the ham magazines during WWII,
as a means of keeping the hobby alive when amateur radio was on hold.

But I don't think this is what the original poster was asking about.
I forget his actual question, but I thought he wanted to know about
radio that worked underground, like in caves.

I can picture an article in 73, I think before it went to the large format
so I'd say 1975, where someone who was a caver did some experimenting
on radio for caving. I can't remember if he wanted to talk to someone
waiting on the surface, or to someone elsewhere underground. It
wasn't a construction article. But he built two transceivers, one
in the broadcast band and I can't remember the frequency of the other
one but I think it was VLF, and he compared the results of the two
frequencies. i sure can't remember which one he found to give the best
results. As a pointer, he talked about building the transceivers in
surplus ammo boxes, for protection to the elements.

If that's the sort of thing the original poster wants, assuming he's
still around, cavers may bea better source of information, at least
for the theoretical. Don Lancaster has written quite a bit about caving,
though I don't remember anything about underground communication,
and maybe there's something at his site at http://www.tinaja.com

> Joe, ka0yos

My guess from the name would have been that it's actually a 49MHz walkie-talkie, but I did a websearch and found a place selling batteries which listed the unit. No mention of the voltage, but it was something like $38, which does not seem like it would be for an unlicensed walkie talkie.

If it is a 2meter rig (or perhaps it's intended for the adjacent "public service band?) I imagine it doesn't run off a 9-volt battery, but I can picture the connector. I have battery holders for AA batteries that have such a connector, and it is convenient for taking such a pack out of a unit, so it probably is in that capacity.

I have only a vague feeling of seeing Pace in the ham magazines. You might look on the case to see if there's some sort of date, or open it up to look for a date on the circuit board or on an IC (if there are any). Given a date, it would be a lot easier for someone to take the time to look for an ad for the unit.

This is also the basic scheme used in many underground cable
locators. One I'm familiar with used a 70 or 80 khz signal,
coupled into the cable in question with something akin to a
clamp on ammeter clamp. A good ground connection is
essential. The receiver gadget was simply a receiver with a
ferrite stick antenna at the end of the pole so that you
could zero in on the cable. I'm not sure what sort of
distance might be achievable, but even with this simple
battery operated equipment, a couple thousand feet in dry
soil was effective.

> Any thoughts on LC filtering, and choke sizing? Any comments?

LC filtering is hardly ever done any more. The primary benefit of the choke input filter was better regulation. With the advent of inexpensive IC regulators it is easier and less expensive to use a large capacitor filter and follow it with an IC regulator. The regulator will even remove some of the ripple so the capacitor doesn't have to be so large.

2946. crossband repeater.....

Newsgroup: rec.radio.amateur.homebrew

Message-ID: <39E45A44.5AEDCED7@vlsi.polymtl.ca>
Source record: 57275

hello,

what about a croosband repeater ????

last two weeks I worked on a very very cheap homemade repeater.

my problem was when I was outside of my car I was not able
to talk with my radio (example when going in a shop)
So I decided to made a very simple repeater.

you have to get two frs radio
the trick is to inject audio from the frs into the mobil in your car
and vice versa.

So when I speak in my frs outside of my car the other frs in the car
receive
audio and inject it in the mobil and activate the PTT.

when the mobil receive audio it goes in the frs and you receive
what your friend say.

On my side I have a VHF mobil in the car, and on my base station too.

Of course you can put ctcss on your frs to prevent noise activating the
PTT.

I'm working on a new version of my repeater.

Hint: it<s usefull to know vox circuitry.

hack crack.....

Gilles

I am trying to locate "Allied Radio" company.
A person says he received as a gift this year, an electronic amplifier
with microphone all mounted on the headset.
Gift came from the "Allied Radio" company.

I have searched the Internet with absolutely no success.
I do see references to schematics for old tube type kits sold
by the original company, not useful.

Does "Allied Radio" exist in some form or by another name,
bought or acquired?
I sure would like to contact them for a catalog.

Also would like any reference to the amplifier with mic mounted
on the headset from ANY company.

Thank you for any help.

Although the availability of high capacity electrolytics wiped out the
choke filter you can't keep a good part down and the L has staged a
major comeback with all those millions of switchers exploiting
inductive energy storage.

So what are you going to do when some unlicensed potty mouthed yahoo, hearing you on HIS FRS radio and figures out your CTCSS setting, there are not many to guess at, then starts using YOUR ham rig! Oops! You would be far better off getting a cheap used "Ham Band UHF HT" to do the same thing. That way you keep any communications entirely within the ham bands while greatly reducing the chance an unlicensed user will be using your rig to transmit on ham frequencies. That's my two cents worth of advice.

How about this: Take a standard dipole. Turn it 90 degrees and feed the end
instead of the middle. Isn't it then a vertical without radials? I don't know
if this is the basis on which these antennas actually work, but it's a thought.

While I don't want to suppress experimentation, this function is built into most dual band radios already. I would also point out that you have a cross *service*, not cross band repeater. While it is not illegal to repeat amateur transmissions onto other services, it *is* illegal to repeat other services onto amateur bands without authorization.

Source record: 57283

Try to realize this is trying to condense over 3 columns of print and I
don't know if you have the article or just the schematic.

Actual schematic changes:
the TIP112 (Q5) is a darlington pair, but incorrectly depicted.

Parts list:
R10 is 330 ohm 1/2 watt (instead of R11)
delete R11

other points:
reduce ripple by increasing C1 to 45,000 microfarads, but headroom is
sufficient already to prevent regulator dropout and the increased voltage
increases power dissipation.

to cut off pass transistors under no-load conditions, install 33 ohm 1/2 W
resistors across base-emitter junctions of 2N3055s and install a 300 ohm (or
less depending on leakage current) resistor between the junction of R1-R4
and ground (or move R5, the 75 ohm bleeder resistor here).

if the power supply will be used near max ratings continuously, increase
size of heatsink and mount it externally with fins vertical.

some fusing schemes were discussed, but you should be able to figure out if
you need some and where to put them.

hope this helps

You will find this company via
http://www.radio-portal.org

It is a search engine especially for radio amateurs and short wave
listeners, with more than 17.000 links. All links were checked, so no junk.

Just do a search for Allied.

But here is a second way: Click on "Search in broad", and combine the
categories "Manuals and Schematics" AND "Vintage and Antique Electronic".

This way you will find many useful URLs. Reviews on receivers, frequencies
for scanners, addresses of domestic and international broadcasters,
DXpedition pages for hams... 60 categories to choose from.

Try it and have fun.

**** Post for FREE via your newsreader at post.usenet.com ****

Dear om`s
if you can help me I`ll be happy :)

I have a Transceiver (Kenwood TS-140S)
But it is not work now

SYMPTOMS :

First time : good receive but audible alarm " UNLOCK "
with morse code time to time .

Now : - open display firs time (forexample 14.000.00)
- after opened display (like . . . .)
- not receive also not any sound or hiss
- not transmit
- alarm " UNLOCK " with morse code repeatly .
- when I rotate Tuning knob display is open
like 14.230.00 but again . . . . . . .after 1 second.

I measured 3.2V on back-up lithium battery .

Something similar happened to my Icom IC-745 a number of
years ago and it was the RAM chip defective. Unfortunately,
it had to be replaced and re-programmed at the factory. You
might check to see if there are any loose or weak
connections involving the battery.

2963. street digital thermometer

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-11 00:00:00 UTC
From: ZL4PY <ZL4PY@mail.com>
Message-ID: <39e4bdd2@clear.net.nz>
Source record: 57292

I had a request from our local community group to help them put up a budget-but looks-totally-professional, large 1m clock and underslung temperature digital display 30 feet above the street in our village before the Christmas tourist trade arrives. (There's only one main street so you can't miss it but they want to enhance its appeal to tourists who tend to drive through small rural towns but apparently will stop to spend money when there is a large clock and electronic temp display :)

The 1-metre analogue dual face clock is no problem and we got that in hand, but the digital temperature display which reads accurate is not so easy for me and I am not quite sure how to approach it. I can't find anything commercial locally or on the web that could be adapted or imported within the deadline. I can manufacture the clustered segment displays OK but how do I produce the electronics to measure the outside air temp and then interface it to the segments?

Anybody got any superbright ideas?

Specs they came up for the temp display are Yellow LED dual face display each with two digits 200mm high and a minus sign for when it freezes. (Temp range experienced here is -35 to +45 centigrade).

Help !!!

You can do the same thing with Microsoft Publisher and print them yourself for free. Probably any publisher program will do this for you. Why pay someone else to do this if you don't have to.

Source record: 57294

There are temperature-to-voltage ICs available from such manufacturers as National Semiconductor. To adapt one would require at the minimum a power supply, op amp, A/D converter, and some interface electronics. But what I'd do is go down to Radio Shack and buy a little digital thermometer, then see if I could tap into the lines going to the LCD. This might not be practical because of multiplexing, but it would be worth a try. It would also, of course, require some interface circuitry to drive your display. (I realize you're not in the U.S., but I'm sure you can get an inexpensive digital thermometer from a number of sources. They're also sold as an auto accessory.) Another way to avoid some of the electronics design is to get a thermocouple adapter. These come with a thermocouple, and directly output the temperature as one mV/degree (C or F). Fluke makes one, although it's a bit spendy, but there are some less expensive ones which do the same thing. You'll find these at electronics parts houses, or by mail order from places like Techni-Tools or Jensen. You could plug one of these into an inexpensive DVM and again try to tap into the display, or you can use an external A/D converter. At one time, DVM chips were available. If you can get one of these, it might have a direct seven-segment or at least BCD output, and should accept the thermocouple adapter pretty directly as an input.

There are better FSK receivers out there. The MC3356 is rated to 500 kbits/s, MC13055 is good past 2 megabits (although I think it's out of production now), MC13155D is usable to over 10 megabits.

You can get all of these, including the 3356, from http://www.shfmicro.com. See http://www.shfmicro.com/ic.htm for the FSK parts.

Very cool. If you modify it so that the PTT from the mobile radio is interrupted briefly every second or two with a 555 timer, you can interrupt the mobile repeat audio with your handheld to talk back if the channel is active (if the mobile is tuned to a repeater).

Motorola made (makes?) a squelch chip (see Micor schematic) that will sense the discriminator in your mobile to generate a very nifty COR output. Forget VOX.

2972. Another Power supply question

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-11 02:52:49 UTC
From: Marc Passy <mpassy#no_spam#@houston.rr.com>
Message-ID: <39E3D600.C4306681@houston.rr.com>
Source record: 57272

After all of the helpful comments on my last question (no sarcasm intended - thanks to all, really), I've got another.

I pulled out my old Navy electronics manuals, and for large current, low voltage (<200 Vdc) PS it recommended an LC filter instead of the standard Cap filter seen on many smaller linear IC PS's. It recommended about a 10H choke and 0.1 uf cap following it. IIRC, this allows a more efficient use of the Xfmr secondary current, as well.

Any thoughts on LC filtering, and choke sizing? Any comments? Thanks in advance.

2974. Michigam Hams

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-12 00:00:00 UTC
From: helmsman <>
Message-ID: <hp4buskqb9f45gu6mtnsevsek9vatn8fm5@4ax.com>
Source record: 57303

This is a call for action for all Hams that want to continue using their MOBILE radios, or even wish to transport their PORTABLE/HANDHELD radios in their vehicles without obtaining a special permit from the Michigan State Police.

On Sept. 27, 2000, Michigan Rep. Mike Kowall sponsored House Bill HB-6012 that amends sec. 508 of 1931 PA 328 (MCL 750.508). Co-sponsors to this amendment are Reps. Cassis, Julian, Shackleton, Birkholz, Howell, Scranton, and Tabor and has been referred to the Committee on Transportation.

Sec. 508 has been completely rewritten.

Subsection (1) states ...shall not either equip a vehicle with a radio receiver, or possess in a vehicle a portable radio receiver that receives...

Subsection (2) does not exempt Hams from the permit requirement as the non-amended sec. 508 did.
Subsection (2) states ...does not apply to a vehicle owned or used by an individual who has obtained a valid permit...
This permit requirement applies to Law Enforcement Officers and Amateur Radio Operators.

This is a bad Bill for Amateur Radio in Michigan on the whole, and especially for those attempting to provide a service to our communities. This is another hurdle which should not have to be jumped by the volunteers that give so much already.

Call or e-mail your State Representative today and let's put a stop to this foolishness. You can find your Representatives number in the phone book or by going to http://www.michiganlegislature.org/ and then scrolling to the "Links to Other Sites" "State House".

HB 6012 reads as follows:

(1) Except as provided in Subsection (2), A person shall not either equip a vehicle with a radio receiver, or POSSESS in a vehicle a portable radio receiver, that receives radio frequencies assigned by the federal communications commission for police purposes.

(2) Subsection (1) does not apply to a vehicle owned or used by an individual who has obtained a valid permit from the director of the department of the State Police on a form prescribed by the director and who is either of the following:

(A) a law enforcement officer certified pursuant to the commission on law enforcement standards act, 1965 PA 203, MCL 28.601 to 28.616.

(B) An amateur radio operator licensed by the Federal communications commission in 1 of the following classes:

(i) technician class
(ii)Tech Plus class
(iii)general class
(iv) advanced operator class
(v)Amateur extra operator class

(3) this section does not restrict or prohibit equipping a vehicle with or using a radar detector.

Violations of this law carry a 1 yr jail sentence and a $500.00 fine.

Your display - I assume it's 3 or 4 digits - you don't say what kind of driver it is using, but it probably could use a 7-segment LED driver.

You might consider using a BASIC STAMP for driving a Maxim 7219 LED driver. (You need 3 I/O's - Data, Clock and Chip Select.) The '7219 can be configured to produce a "+", "-" etc. You can also use the Dallas One Wire temperature sensors. The stamp is extremely simple to program.

If you don't want to go the bother of a STAMP, you can use a Harris/Intersil Digital Voltmeter chip like the ICL7106 or ICL7116. (The latter has sample and hold.) Use a National Semiconductor centigrade sensor (LM35DZ I think). You will have to use an IC to scale the output of the sensor to the meter, but this is trivial. The Harris device incorporates a device driver with one output line per segment. They have comprehensive datasheets on their website.

Lastly, I know that Velleman is big over there, I am sure that they have a kit which will do this. Their webpage is www.velleman.be.

Michael,

You should be able to order the parts you need through any
Radio Shack store. Check about the price of a complete new
mic while you're there. They may not be all that costly.

Back to school, Richard <GG>

The centre tap means you have balanced heater lines running around the chassis or whatever. This means you generate two opposing hum fields which cancel each other out. Very important in high gain low level audio stages.

Actually the ICL7107 (LED drivers) is more what you want. If you look at
the spec
sheet they have a thermometer app that uses a diode connected transistor
as a sensor
and by fudging the ref and input get a direct read out. I've had one
running that way
for about 15yrs now with no problem.

The 7107 has direct segment drive. If you are multiplexing you may want
to look at a
chip with multiplexed output (ADD3501/MM74C935 for example) and see if
you could do the
same sort of thing.

If you already have a computer involved (or someone who could put
together a small micro
for you) consider some of the Dallas semi sensors - they provide serial
digital output and
are fairly easy to interface.

You don't mention a price but my guess is that you are venturing into a custom design. A search on YIG Oscillators may lead you to a manufacturer here on the web. YIG's were popular at one point due to the linear tuning curve which helped minimize close in phase noise. Watkins-Johnson used to be in the business. Last I heard was that they are now RACAL. Also you may be looking at something which is going to be export controlled from the states depending on the technology and specifications.

Another possibility is SciComm in Garland, Texas. They are part of the Andrews Group now. E-Systems is another possiblity. I know they were bought out. Think it may be British Aerospace Engineering now.

GENETIC
FACTOR EYED

Biofeedback Systems in Los Angeles, is looking for
volunteers with a rare genetic inheritance, to participate in a
proprietary study.
At present, it is believed that fewer than one person in 400
carries a rare genetic makeup that predisposes them to having better
health than most, a strong immune system, and an unusually high energy
level. Aside from behavioral manifestations such as a generally positive
outlook on life, the principal evidence that this genetic factor is
present, is mirrored in the shape of the eyes.
It should come as no surprise then, that the eyes themselves
would be used to select the people who are nost likely to have this
elusive gene. Individuals selected for this study will be white,
Caucasian, of either gender, and between the ages of 25 and 50.
Compensation will be determined by a collective evaluation of the total
number of applicants selected. Drugs will not be administered as a part
of the study.
The eye contour that embodies the required genetic trait,
has been roughly described as "almond shaped," but this is not an
adequate definition. Exact specifications follow.
Looking in the mirror with the head level, the qualified
applicant will see that the lower half of their eyelid is CONVEX UPWARD,
from the bottom on either corner. The bottom part of the iris will be
partially covered by the lower eyelid (this is important), and there
will be a reasonable symmetry between the eyes on the left and right
side of the face.
Applicants must submit a close-up facial photograph for
evaluation. Since no risk or disease factors have been associated with
this gene, any risk to volunteers in the study is contraindicated.
Interestingly, it is apparent that the "energy gene" as it has been
called, may be dormant in one or both parents, yet it may be actively
transmitted to their children; but it is only infrequently active among
two or more siblings.
If you know of a person, or happen to notice one whose eyes
might qualify them for this study (preferrably among those employed in
the technical community), you may want to share this data with them.
Since so few people are fortunate enough to carry this gene, your only
encounter with one of them may be in a fleeting moment. It would be
wonderful if you had a copy of this announcement with you, and could
share it with a prospect in passing. Alternatively, you could specify
this website and posting date, or perhaps my email address.
They may then contact Mr. Norman Swartz at this

[virus-proof] email address: analog24@webtv.net (It is not generally realized that, because webtv has no hard drive, it is immune to destructive computer viruses.) Or, they may write to: Biofeedback Systems, Post Office Box 8501, La Crescenta, CA 91214. No telephone calls please. Depending upon the number of volunteers selected, applications will be accepted through the end of December 2000, with a possible extension through 31 January 2001. The duration of the study will be a minimum of two years.

Fairchild (formerly National Semiconductor) still makes the DM7407N
("N" = DIP/ through-hole version. TI made it for years as well but I
don't know if they do so now.

If my memory is not failing me, it wasn't discontinued with the other
74xx series due to it providing open collector outputs which can sink
a good amount of current. Can't get the same rating in the 74LSXX
series.

Don't know off hand if the 7417 is or is not still available. May be
mistaken but I recall that being a high voltage (30 volts??) version
of the 7407.

regars - greg

). As I recall this is an open collector

Hello Brian,

Thanks for the info. I have the articles. I am actually looking for
inputs on how to modify if any, of the cable tv boxes. Had problems
understanding what is going on in those converters. But I believe I understand now that it
are in fact double conversion boxes with as
2d IF either channel 3 or 4 around 55, 60 Mhz Intend to build an hybrid
design of the K2BLA and the poor men's spectrum analyzer. With modifications in the log IF
amplifier part. The poor men's design appears to come with 3 tuners covering from 5 MHz
all the way up to
1.7 Ghz. I have no idea about variations in sensitivity etc if one
sweeps to the freq range. I have lots of plans to start building stuff
and I think having some simple form of spectrum analyzer will be very
helpful and building the spectrum analyzer will be a nice project just
by it self.

The latest aug 98 design is a very nice design but it overs only a
limited input freq range. The performance and possible calibration
beats all the others I think. I though am intersted to be able to scan the VHF/UHF and
1296 MHz and Radio Astronomy bands.

Also intend to keep a sort for progress report on the construction
on the web and perhaps stimulate some more SA building.

Hello Bill,

Thanks for email and info. Yes indeed the search engine came
up with a number of old eBay pages and other links. Wished I had
known that earlier. Thought those CATV boxes were a lot more
expensive but then technology marches on and boxes get smaller or
more poweful.

Thanks es 73

hmmmm.. Doesn't exactly measure up.
I did a search for "TS-520" and "TS520" in "amateur radio"
and got *no* hits.

They do make low power EPLDs and FPGAs, but
clocking speed is still the big factor in power consumption.

There are serial in circuit programmable parts available.
You can get the introductory development software for little
or no cost.

>Also, what's the learning curve like and how should I
>get started?
Check out the web sites of the mfgs like Lattice. You should
be able to find mfgs and their distributors using a search
for FPGA and EPLD. Their reps can point you to more help.
There are also free (or nearly so) seminars the mfgs put on
around the country just looking to get you started.

>---peter

Well if you decide to dump all your discrete let me know I'll send you my address.

Actually I'm perplexed by modern surface mount devices. I don't personally have a problem using them, unless you count mfgs that don't come out with the part on schedule. I don't see any local places for hobbyist to get them or the tools to handle them. But I also don't see how the local or national stores can possibly keep up with the changes in technology and not have to eat their inventory every six months to a year. The same goes for repair shop suppliers.
As an example of how fast the technology is moving let me tell a story. Six months ago I completed a design that included two gates on a 74HC04 inverter to give me I and Q not. For prototyping the SO-14 (half a fingernail in size) surface mount part was available from Digikey. Two months ago I replaced that part with a TinyLogic dual inverter that is about the size of two of the SO-14s pins. I've just tested a new I/Q modulator that doesn't need the inverter and contains it's own buffer and 100mw driver amplifier all in a package about the same size as that SO-14 mentioned above. My question is, where are the hobbyist going to be able to enter the game ? And lord help the repair shop trying to get replacement parts that only had a 6 month production run. I guess that's why Japan junks 500,000 cell phones a year. 73 de Perplexed.

>
>PS - to Tom: I'm also peter_nelson@agilent.com (I'm a sw

I need a one degree resolution. I found a circuit searching on the web which promises that.
Could someone please check the circuit at
http://home.maine.rr.com/randylinscott/apr99.htm
and say if you think it could be reset for a lower range of temps. Looks like the zero reference point can be set for crushed ice temp but I don't know these chips or the manufacturer. If it goes below zero would it display in minus degrees and could I pull out a voltage to light up a minus sign?

I presume I can drop off the components associated with the third segment display? (I only need two segment displays).

Thanks for any help...

2999. Help with tube power supply

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-13 00:00:00 UTC
From: Gary <turtle@owc.net>
Message-ID: <l1pduskdiifhhv7a6s4vl5d2ru5pq3tp1v@4ax.com>
Source record: 57328

I am constructing a power supply for a TCS 12 transmitter / receiver. I requires; 210 volts @ 85 ma and 440 @ 200 ma. So this means if I use solid state rectifiers I will have to start out with 155 vac and 312 vac in order to get 210 and 440 volts DC. I have a transformer that is rated at 175 vac @ 85 ma that will get me 247 vdc. Well I checked the transformer with a digital volt meter and it measures 209 vac. I take it the rating is 175 vac with a 85 ma load. With a tube type rectifier I can expect a 40 to 90 volt drop, with a solid state rectifier I can expect a 40% increase in ac voltage(1.414 X AC).

My question is: What is the best way to bring these voltages down with out resorting to resistors? Could I use chokes?

Maybe I should be asking, how voltage tolerant is the TCS 12?

I think that you would find the ICL7107 (or ICL7117) easier to implement, you don't need the transistors to switch the "Digits". The '7117 has sample and hold and as Dennis says, there is a schematic right on the Datasheet for setting the zero. The National Semi LM35DZ is a TO92 device with good linearity and acuracy to about 0.5 deg C. but the transistor -MPS3704 is cheaper and easy to get hold of.

I have a spare ICL7117 DVM Chip and some LM35DZ's -- if you care, email me privately.

Subject: ** FLEA at MIT ** Sunday October 15th Cambridge MA
Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming Sunday... The seasons last FLEA at MIT...

*** Great News, we again have full use of the garage... :-)

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday October 15th 2000
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23-W1BOS/R and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

3002. Re: Help with tube power supply

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-13 00:00:00 UTC
From: JW <jdwalton@home.com>
Message-ID: <39E7162B.CCFEB3E8@home.com>
Source record: 57331

If you resistors, the voltage is going to swing (E=IR) as you draw any current.

Well, we could get really complicated and chop the AC going into the transformer, but the switching transients will cause RFI more serious than my one tube 6DQ6B transmitter of 30 years past. (Oops, it was 37 years ago!)

The lower voltage is probably more critical. I have regulated high voltages with a floating LM317. You put zener diodes in the ground return of the regulator -- see "The Art of Electronics" page 370 - it works very easily -- the authors have included a transistor for short circuit protection.

If you want to heat your house, you can use a 6L6G as a regulator -- see the ARRL handbooks.

I don't know about a replacement, but both are listed as "hex buffers
with Open-Collector High Voltage Output". My old National data book,
the only one I have for regular TTL, doesn't actually specifiy the
difference between the two. However, according to Don Lancaster's
"TTL Cookbook", the 7407 can handle up to 30volts on the outputs, and
can sink 30mA, while the 7417 can handle 15 volts on the outputs, and
can sink 40mA.

The latest Digi-key catalog lists both, along with some 7400 series
inverters with open collector outputs.

I did not see a replacement in my ten year old ECG replacement guide.

I assume this is to replace an IC in an existing piece of equipment.
If it's to build something from scratch, one could always use a
regular output device, and add a transistor for the open collector,
or track down one of the other open-collector inverters, and add
an extra stage of inversion.

VERY tolerant!
I've run my TCS-13 on CW for 30 years at about 750 volts on the plates.

Check out using choke input schemes to keep the peak voltage down to some number less than sqr(2) *rms. The ARRL handbok and other sources have various schemes to calculate ther effective voltagae of various choke input schemes. The primary caveat is to watch for the critical inductance value and not let the choke/capacitor pair become resonant at the ripple frequency or you have the preverbial AC short at that value. rarely a problem. I you meet the critical inductance value the output of the combination is typically 0.9 *rms value Good luck

You can jump thru alot of hoops (hoops and garters and a
hogshead of real fire) and maybe figger enough mods to make
your 'existing' transformer acceptable, but
http://www.oldradioparts.com/ has a great listing of
transformers available that may better suit your needs at
very decent prices. I just found an impossible exact
replacement substitute via that route.

I wonder about this too! I sometimes think that a good reason
to stock up on CD4xxx or 74HCxxx IC's is because I can't imagine
anyone stocking these much longer. Whose uses them besides
hobbyists?

On the other hand with everything going SMT how do hobbyists
break into electronics? Most of the best and most creative
engineers I know got into electronics orginally as kids as hobbists.
When I was 16 I was building Heathkits for my ham shack and
test equipment and rifling through old TV's at the dump for parts
for homebrew projects. I owe my whole career to an 8080-
based PC I made totally from scratch of my own design
except for the Don Lancaster "TV Typewriter" I got from
a magazine article design for a display terminal. I wrote
some articles in Byte Magazine which launched my career.
These involved extensive 74xx-series logic and lots of
PC-board design and soldering.

No wonder the US is turning out fewer engineers despite the
high tech boom.

Thanks to all you guys. I think the 375-0-375vac @ 200ma for the transmitter and 175-0vac @ 85ma for the receiver will work. I'll be using a full wave and a full wave bridge respectively.

Jan 1995 QEX
Jacob Makhinson

High Performance Crystal Filter Design
Communications Quaterly, Winter 1993
Bill Carver

You might also search the web for these people. I know Wes Hayward has a WEB and is very helpful.

I've talked with someone who had done it. They said to use the same techniques as you do for fundemental mode crystals at the lower frequencies, e.g. 4 - 10 MHz. At 70 MHz you are probably using over-tone crystals.

You can also buy 2 and 4 pole monolithic crystal filters. Prices are not too bad. Check Digi-Key. Also check the ads in the back of professional wireless magazines, e.g. RF Design. There is a company in Phonix Ar. that I bought some from. Don't remember the name off of the top of my head though.

It is on my list of things to do

Personally, my "last good ARRL Handbook" was 1993. YMMV.

Consider also the ARRL UHF/Microwave Projects book,
Davidoff's Satellite book whose title changed with the
last edition, the VHF/UHF DX Book, and just about every
other book on VHF/UHF amateur radio published in the last
30 years.

I got flamed - big time - on the AMSAT mailing list over
essentially the same issue. People seem to think that books
are somehow offensive. Sad.

Get the part numbers right: the leading 2 or 3 is not optional,
and I don't recall any hyphens in Japanese transistor part
numbers.

Once you have that, try somebody like RF Parts. The last
dual-gate MOSFETS I bought (BF961/BF981) were over the
counter at Cricklewood in London and Les Cyclades in Paris.
They are providing excellent service in devices like my
weather satellite preamp.

3038. Re: WTB: bare silver plated solid copper wire

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-16 00:00:00 UTC
From: Marty <nfn04028@naples.net>
Message-ID: <39EB402C.CF2C8CE6@naples.net>
Source record: 57216

I'm still using a silver plating powder I made up myself some 30 years ago, probably very similar to the Cool-Amp formula. Used it on coils, chassis's (copper or copper plated) and for renewing relay contacts. The coils in my big amplifier are still bright any shiny after 25 years.

It's easy to put together if you can buy or otherwise obtain the basic silver salt; either silver nitrate or silver acetate will work. The other ingredients are sodium chloride (table salt) and sodium potassium tartrate (cream of tartar) which you can buy in the supermarket.

The formula is based upon parts by weight, but it's not critical:

silver salt 1 part
sodium chloride 3 parts
cream of tartar 2 parts

Mix the dry powders and store in a closed container.

To use just put a little of the mixture on a piece of wet paper towel and rub it on until the base metal no longer shows through.

Most of the wire I've used was from stripped and straightened #10 or #12 out of UF-B or similar building wire sold by Home Depot et al.

Tnx, Jim! I've also come across some 'lite' articles in several
of the older QST Hinks & Kinks books. Since the homebrew construction
of these will be 'different' for every builder, I wanted to get
as many ideas and view points as possible.

I have a bunch of 3"x5"x3/4" marble blocks (originally cut and
polished for small award/trophy bases) and I *just*know* they're
gonna make real purrty bases for a set of paddles!

3044. MURS

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-16 00:00:00 UTC
From: Rally The Sheep <nospam-rallythesheep@crosswinds.net>
Message-ID: <sun04mkug93s66@corp.supernews.com>
Source record: 57222
Cross-posted to: alabama.birmingham.radio.amateur,alt.ham-radio.packet,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy

In case ya'll haven't heard, on July 12th
the FCC created the Multi-Use Radio Service.
It's for people who want to be on the radio
but don't want to have to learn all the rules and
stuff for the amateur service. The difference between
MURS and CB is that MURS will have repeaters, packet,
data, imaging and, like CB, won't have any regulations.
Oh, there is one regulation, you can only transmit up to 2
watts of power. (I got this info from QRZ.com, the like to
the article below).

The full article is here:

http://www.qrz.com/articles/00/10/15/1215251.shtml

My personal opinion (which probably doesn't mean much
to anyone but me), is that the FCC isn't going to stop at the MURS service.
They're just going to continue on, and eventually, the entire amateur
service
will be regulation free.

What's your opinion?

Anyway, the reason for this posting is because most people don't
know about the MURS service.

(I'm probably gonna get tons of spam from this, too.)

73,

Rally The Sheep

> Consider also the ARRL UHF/Microwave Projects book,

That one's really underrated, IMHO. There are now two Microwave Projects volumes. I think the more recent ARRL Handbook strategy has been to move the more specialized stuff (like microwave construction and theory) out into separate volumes. I really can't argue with that trend, even though it does have the side effect of making the main Handbook seem 'dumbed-down' compared to older versions that seemed to have more meat on their bones.

My main complaint with the ARRL Handbook has always been organization (e.g., my earlier example of discussing image-cancelling mixers before crystal sets in the Receivers section), not necessarily breadth or depth of individual subject treatments.

FRS is pretty busy here in the Salt Lake City area. However, I don't see MURS as a serious competitor to Amateur Radio.

And who will 'own' this gene (whatever it is) if it IS found and perhaps patented?
This almost smacks somewhat of the Nazi "Racial Purity" business.
Hitler might be in tune with this type of research
But; we should be very careful when people go looking for "the best athlete" or the "the best swimmer" or "the best baseball player" or the "smartest intelligence" or "the best organizer" or the "best assassin" or the "best religious" or the "most peaceful" gene" etc. etc.
Since nature has a nice habit of making fools of our 'knowledge'; there is no reason that it won't happen in regard to gene research either.
I'm willing to bet that the genes belonging to Alexander Graham Bell, Edison, Madame Curie, Marconil, Einstein, Franklin D. Roosevelt, Churchill, Charles Darwin, Ralph Bunche, Trygve Lee, Jane Goodall etc.etc. were/are all pretty normal. They were just great people in the right places at the right times.
Me; I'm happy with my energy level, motivation and achievements; so far.
So "let's be careful out there".
Granddad (approaching 70)..
PS. What IS a post like that doing on this news group anyway?

Rally The Sheep,
Do you really see MURS as being threatening at all
to amateur radio? I don't. Seems more like the manufacturors
trying to revilalize their 'color dot frequency' radios.
I can see where there could be lots of interest in this.
As I read the proposal, it allows voice, and digital modes,
repeaters, and paging. By the way, it's 2 watts ERP, so
that opens up a bunch of antenna options. Interesting
options...

Has anybody attempted to build the project from Randy Henderson's book "Build your own intelligent amateur radio transceiver?" If so, how accurate were his schematics and pcb layouts to the actual working design? Also, anybody know where you can pick up an Intel 80c31 microcontroller?

Something you might consider is buying an old Wavetek SAM
CATV signal level meter off of ebay or wherever. They go
dirt cheap these days. They have a fully functional
spectrum analyzer built in. IIRC, the range is 4-450 Mhz
and its all tunable for width, res, etc.

Email Address Is Below !

Brand New ASTEC:
VS3-K0-K2-K3-00
Single Phase 85 - 264 VAC /// 47- 440Hz Input
Three terminals for output:
one 2v @ 150amps
two 5v @ 150amps
three 12v @ 62.5 amps - For Ham & CB Gear

Detailed Specifications On Power Supply:
http://www.astec.com/products/1150.astec.pdf
(Must have Adobe Acrobat installed to view)

This page show a different model for sale:
http://www.newark.com/
Search for "manufacturer" part number and enter "VS3"
for other models then use the PDF (Adobe) specification
chart to compare output watts / amps.

One example is a VS3-C6-C6-20
which is VS3 or 5x8x11 case
Terminal one is "C6" which is 28v @ 32.1amps
Terminal two is "C6" which is 28v @ 32.1amps
The unit on that page is about $2,000

I'm selling this for $120 UPS Shipped

Hi, Laura

On a couple of occasions when I was in Paris on business, I needed quick replacement parts and found it difficult to locate electronics stores (admittedly my own fault because unfortunately I don't speak French very well.) I found one near Gare du Nord which I think was called St. Quentin but I would like to find others just in case something goes 'pop' on my next visit.

Could you let me know the approximately location of Les Cyclades so I can check it out?

Thanks and Best Regards, Roy G0WMF / 7J1AUA

My usual recommendation: pick up a local electronics magazine
(e.g. Electronique Pratique or Elektor) and have a look at the
ads.

> I found one near Gare du Nord which I think was
> called St. Quentin but I would like to find others just in case

That would be St. Quentin Radio. 6, rue St. Quentin 75010 Paris.
I've dropped a few francs there myself...

> Could you let me know the approximately location of Les Cyclades so I
> can check it out?

11, bd. Diderot 75012 Paris. Across the street from Gare de Lyon.
If they're closed for lunch the restaurant next door is good
(it *is* Paris, after all... :-).

I can't advise you on linguistic matters, because all I've
ever spoken in either establishment is French. Which they
speak just fine. :-)

It might seriously cut into the No Code Tech future numbers. Lots of
them had no other goal in mind in ham radio than that sort of usage.

I would be concerned that in technology terms this is an "old" book. A lot has been learned about transceiver design and implementation since it came out.

No doubt his design will function, but after all that work - how well?

Does he include lab-quality evaluations and measurements of performance parameters in the book?

Unless you are willing to devote a *lot* of time and hard work to building such a radio, you would be better served to spend that money on a good used current-design transceiver of known performance.

Also, to be frank, you need to closely examine your own abilities and experience level, as well as the availability of *good* test equipment. This is not something you are going to build with a VOM from Radio Shack.

Sorry to sound like a pessimist, but when that book came out, there was probably some possible reason for one undertaking such a project. I doubt that such reason is really justified now. In any event, it is not a light undertaking for anyone without substantial experience in this area. And, that experience had better be heavy on the r-f side; a good computer/digital background just will not cut it.

As I recall, that book was originally published by TAB, or one of its
imprints. The veracity of anything printed in a TAB book should be
treated as if it came straight from the presses of the Brothers Grimm.

If you have the skill and experience to achieve good results in a
project like this, chances are, you don't really need a book that

purports to be a step-by-step guide. OTOH, if you are just getting started in electronics, you're better off starting with something simpler regardless of the quality of the text you're following.

The good news is, anyone who tackles a project in a TAB book and actually gets it working will have gained substantial design and troubleshooting experience in the process. :)

I would not discourage the original poster from homebrewing anything at all, the way you (George) seem to be doing, but I would suggest starting out at a more realistic, achievable level. For instance, by building a few of the (much better-edited and -proofread) projects in the ARRL Handbook.

3065. Re: MURS

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-17 00:00:00 UTC
From: k5dh@raytheon.com
Message-ID: <Y24H5.5$W94.1159@dfw-service2.ext.raytheon.com>
Source record: 57243
Cross-posted to: alabama.birmingham.radio.amateur,alt.ham-radio.packet,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy

I have bad feelings about this MURS thing...

What I can see happening on MURS is the same thing that happened on 11m CB. MURS'ers will buy inexpensive 2-meter FM amplifiers at hamfests and connect them between their MURS radios and their antennas. So much for the 2 Watt limit! No one pays attention to the 5 Watt limit on 11m CB either... they use 10 meter amps. With 2m amplifiers so commonly available for such little money, I think this will happen virtually overnight. MURS also allows external antennas. Soon, there will be MURS'ers using modified 2m directional antenna arrays and high-power amplifiers to work bootleg VHF DX.

Someone else has already pointed out that the MURS radios will be merely the existing "color dot" type radios re-hashed (including some of the frequencies that were once "color dot" frequencies, such as 154.600 MHz). This could pose a problem too. Many of your favorite fast food joints, such as McDonald's, Wendy's, and so on, use some of those same frequencies for the two-way radios in their drive-up lanes. Can't you just picture the MURS CB'ers, running high-power amplifiers, giving fits to the people working the drive-up lanes? It's gonna happen, folks!

There are countless thousands of "color dot" radios wasting away in closets and drawers since the advent of cheap and effective FRS radios. FRS offers 14 channels vs. one or two channels, PL tones for a degree of privacy, they cost half or less what the "color dot" radios cost, they offer similar range but the UHF signal seems to pass through buildings better than the VHF does, and FRS radios run on common household batteries instead of the usual NiCd packs. I guess the only big draw for MURS is going to be the ability to (illegally) use big amplifiers and to use powerful antenna systems. MURS will be a boon to the bootlegger, but of no value to the intended users. The FCC has bungled again!

Flame away, folks. I'm wearing my Nomex firesuit...

K5DH,
I agree, MURS is going to be subject to all the abuse that
other bands are subject to. It's a shame too, it could be a
fantastic oportunity, if everybody 'played' fair. There's
one 'happy' thought, though. Since it's VHF, it should be
easy to 'DF'.

I was so sadly disappointed when I purchased a 1997 handbook to replace/supplement my 1986 that I have not even considered any other ARRL handbook/reference book since. From what I see here, I may have to look at the UHF/Microwave projects book. I can't count the number of projects I have built out of the ARRL handbooks over the last 40 years and am really saddened to see what the handbook has become.

3070. WTD: Worn-Out Nixie Tubes

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-17 04:07:28 UTC
From: afranzman@aol.compute.com
Message-ID: <20001017000728.05079.00002313@ng-fy1.aol.com>
Source record: 57228

You may have seen my earlier posts on buying/trading Nixie display tubes with digits over 1 inch (25mm) tall, or my other posts regarding the possibility to restore such tubes that have been blackened by long use or excessive current.

Though I am still seeking more of the large size Nixies, I now have sufficient information to begin experiments into the possibility of Nixie tube restoration.

For my experiments I need Nixie tubes that are no longer useful due to darkening of the glass, and/or failure to fully and reliably light one or more digits (up to and including complete failure to light at all.) I can't use tubes having physical damage such as cracked or broken glass, or pins broken off.

Due to the nature of the work necessary, I can only use tubes with digits 5/8 inch (15mm) tall or larger.

Anyone having such tubes is requested to contact me regarding donating or selling your Nixies to me.

If desired, I will pay reasonable shipping costs and a nominal price per tube depending on what you have to offer.

Please contact me by email. See below for a hint to get past my spam block.

Alan "A.J." Franzman

Thanks for your concern about the project...however, your reply raises a question. The book was published in '97...3 years ago. Does transciever technology really change so fast that the design in question would be out of date? I realize that the design was probably several years old at the time of publishing, but I don't think too much has changed in HF technology in that time.

Also, the challenge of building is the primary reason that I am interested in doing this...

Thanks again.

Source record: 57153

I built the MRF966 design from the handbooks of the early '90's. I built several 2m and 70 cm models while fine-tuning the sequencer to protect the preamp.

This design uses an obsolete gasfet, so avoid committing to it.

The piston tuning caps are critical. Don't go cheap as you will not get long life or much gain from low quality caps.

Tuning the preamp without a network analyzer will be acceptable or may not. Do you feel lucky? I peaked the unit using a signal generator and attenuator. Then my employer got an HP network analyzer. My efforts got 10 dB gain over a 30 MHz span. The network analyzer showed me where to peak it for 17 dB and a 10 MHz span. This may not be the lowest noise point either. But I was happy with more gain in-band and less business radio splatter.

In conclusion, 70 cm preamps can be homebrewed by a careful builder. To achieve the full potential takes professional equipment. I learned a lot and haven't tweaked those preamps for years.

There are still plenty of kits out there, even with Heath gone. And even SMT is pretty manageable, at least the larger stuff. Norcal has a very simple SMT kit, the SMK-1, to get folks started and to warm up for a more elaborate kit next year.

The Internet has made homebrew a lot more manageable than it used to be. Not only are there all sorts of online sources for parts, but there are online forums like this one, and especially, QRP-L, to trade ideas with others.

Back when I started this stuff, getting a part meant writing off to Allied Radio and waiting months. If Allied didn't have it, or if it was too expensive, I'd have to physically go to New York to wade through the stuff on junk row. Most likely it would take several trips.

Now, most common parts are available in 2 days with a simple call to DigiKey. Oddball RF parts may take a little longer, but there are multiple sources. Designs by the thousands are available online, and many of the online forums have discussions on what is good, what isn't, how to improve this or that.

Although the model of getting involved has changed, it's a lot more approachable. Just that old dogs like us gotta learn new tricks.

Last year, I undertook to build a 2N2/40, and I was nowhere near 'ready' to undertake such a project. You are right about a *lot* of time, but the learning experience was well worth the time and money. If the objective is to get on the air, then certainly go out and buy an Icom. But there are other possible objectives, and building your own rig has many rewards. Indeed, I would suggest that those who go out and buy a commercial rig are missing out on some of the greatest thrills of ham radio.

One of the things that really enhanced my experience was NOT having any test gear to speak of. Every measurement I wanted to make was a design experience. Not easy, and not quick, but very educational.

I am surprised to learn that most shacks you see displayed have only
one or two shelves, while I have so much equipment to use that I need
at least 5 shelves in the shack and some 19" racks in another room

No. HF communication was a solved problem 30 years ago -- all else is
window dressing, when it comes right down to it. I didn't quite grasp
what he meant by that "old" remark myself.

> Also, the challenge of building is the primary reason that I am interested
> in doing this...

That's the right reason, the only one no one can argue with. :) Go for
it! Just don't be surprised if it doesn't turn out to be as cheap or as
easy as the book may make it sound.

One of the main reasons for building a preamp is for LOWEST NOISE not the most gain. Many times you will not get the most gain at the lowest noise point. You can make up the gain with another stage if needed, but too much gain and you overload the other parts of the receiver and you can get the intermod and other problems.

Have a look for an Agilent (HP) mmic amp. Perhaps a Minicircuits mmic
would easier to get. The design is simple, a series current limiting
resistor,
you will probably need a couple of dc blocking caps.
An inductor for a choke and a bypass cap would be a nice addition. 73 Bobby
PS. I think these amps sell for $ 2 or so.

3092. DECStation 3100 Monitor Replacement?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-18 06:40:45 UTC
From: doug@_REMOVE_spotcheck.org
Message-ID: <8FD11A24DdougREMOVEspotchecko@207.217.77.26>
Source record: 57151

I have an old DECStation 3100 RISC processor I acquired from my workplace when they decided it was time to update it. Great machine for its time, but problem is, the monitor is shot (it's a monochrome VR150 AA) and I'm looking for something to replace it with.

The adapter cable from the 15-pin male plug on the machine to the BNC adapter to the monitor seems to be in good condition. Does anyone know of a particular monitor with a BNC connector that I could get to replace this one with (mono is fine), or is there any way to use a standard monitor of some type with a little tweaking of the pinout from the DEC (yes, I'm a bit of an electronics hobbyist!)?

I'm just getting into packet radio, and would love to use this machine to interface with a TNC and amateur radio to play with. Thanks in advance!

HAMFEST October 29, 2000 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST - October 29, 2000

LINDENHURST, LI - NY

On October 29, 2000 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.
This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and accessories, software, books, technical manuals, ARRL information, Amateur Radio License Exams, Door Prizes.

Advanced registration is $15.00 each table. Tables at the door are $20.00 each. Contact Walter Wenzel KA2RGI at 631 957-0218 for table reservations. NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available.

General admission is $ 6.00. Wife's and children under 12 admitted with no charge.

VE - ARRL - 12:00 NOON at Babylon Town Hall, 200 E Sunrise Hwy, Lindenhurst. For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID),
and the examination fee, to the exam session. Current ARRL/VEC fee is $ 6.65,
exact change is appreciated.

Talk-in will be via GSBARC Repeater on 146.685 -600 136.5 PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 PM following the Newsline Report on the W2GSB repeater, 146.685 -600 136.5 PL required. You may also write to:

Great South Bay ARC
P.O. Box 1356
West Babylon, NY 11704

E-mail GSBARC info@gsbarc.org or visit GSBARC online at
http://www.gsbarc.org/hamfest.htm

Hamfest Schedule - March 4, 2001 - Great South Bay ARC and Suffolk County

I was checking out one of the 70cm articles and it was in complete german.
I didn't find any english in that article, and no english translation
elsewhere related to that particular article.

I looked at about 5 more of them all were in german.

I assumed after that, that most or all were not something I could
use...perhaps I'll go back and look for something again...

Thanks.

I don't exactly have a "how to" to offer, but I do have some pictures and a brief description of a set of miniature paddles that I built a few years back and still use with one of my QRP rigs. Go to my web site, click the "My home station" icon in the menu, and in the list of HF equipment, there's a listing for an NN1G Mark I 20m CW transceiver with a click spot for the miniature paddles. Take a look at the pictures, and email me if you have questions. My design could inspire you to make something similar of your own design.

Some of the older DUBUS articles were in the original language only, either German or English.

More recent articles are always bilingual, but they are mostly not available on the web. Articles since 1990 have been collected together and published in the DUBUS-TECHNIK books which are still in print.

To see the contents lists for DUBUS-TECHNIK Volumes III, IV and V, follow the links from http://www.dubus.org There are three 432MHz preamp designs in Volume III, and an excellent one in Volume IV.

Come to think of it, another place to find low noise preamplifiers for 432MHz on the web is in the 432 and Above EME Newsletter back-issues. Recent issues are at http://www.nitehawk.com/rasmit/ (but I don't recall any recent new designs). Technical material from older issues is at http://www.qsl.net/pa3csg

What's the problem? Looked clear enough to me. You know
the sample rate, because you set it yourself. You know
what frequency you want. Generate samples and blast them out.

I used a slightly different approach for my mother. At her normal viewing distance it was not possible to make the TV volume high enough without distortion and even rattling the cabinet. (Let alone driving anyone else out of the house!). I used powered computer speakers from Radio Shack and placed them close to her. The TV set can be operated at normal volume while allowing her to set the speaker volume. Since they are close they do not need to be so loud as to be annoying to others. Using purchased speakers, cables and adaptors wasn't the cheapest way but that was necessary because I had no access to tools or supplies at the time.

This has been done many times using plain dorbell (or "thermostat") wire. One secures a loop of cable around the perimeter of the room and wires all the conductors in "series" to create a loop of several turns (where #"turns" = #conductors). The resulting loop is then fed from a conventional output that would drive a speaker.

HUGE??? What did you do with all that you learned about antennas during your learning to be a ham, or did you learn anything at all?

Huge to my mind is an 80 meter full-wave horizontal on top of a 70-foot tower. Or maybe and 80-40.

I have built a whole series of small and miniature paddles based upon switch contacts salvaged from Telephone switchboard spring-leaf switches. The smallest is built INTO the key Jack itself, and has silver contacts and adjustable spacing. The St. Louis QRP club has adopted my design and tagged it the "St. Louis Key". Soon an article will appear, along with a possible kit of essential parts.
Some variations of the theme are: straight key. Iambic paddle. Single lever paddle. Combo with straight and paddle on one base (smallest version for combo is only 1/2 by 3/4"!)
I favor the single lever paddles myself, and have worked around 343 countries with HB paddle made from one of these switches, on a Plexiglas base. Fore 2000 I built a "special: on a brass base, and use it almost all the time now.

A FB quality of the St'Louis Key, is that you can plug it directly into the front of a rig like the FT-1000 or IC 756, and use it for casual sending without taking any table space.

Maybe you can get some ideas from this. Pictures on my webpage soon.
Happy Building, Geo>K0FF

If your friend has a hearing aid then there is another way around it. There is what is called a Loop system manufactured by Sarebec (not sure on spelling) this takes an output from the TV as a scart or mircophone stuck to the speaker. From the box there is a wire that needs to be placed around the room. The deaf person then switches their hearing aid to "T". On the box there is a volume level so that the TV can be set to a normal level and then the Loop System can be set higher. Also this would be better as more than one person with an hearing aid can listen and also there is an independent control on the hearing aid.

I hope this has been some help

Could we confirm the part number, please?

The AD9754 is a fancy digital to analogue converter with all
sorts of bells and whistles. It's not a DDS at all.

The AD9854, on the other hand, is a fancy DDS chip, also equipped
with all sorts of bells and whistles.

Why not just set the TV volume high enough so that the hearing-impaired person
can hear it OK, then attenuate the other output?

Look at this schematic:
http://www.qsl.net/we6w/projects/pixie2.gif
it's for a little QRP radio, but it uses a LM386 for the audio. Just
duplicate the circuit for the LM386 portion. If you do a search for
LM386 on the web you'll probably turn up some other schematics as well.

I don't have the data sheet on this part. I use the 9850 which has a
32-bit phase accumulator.

32 bit DDS_data word = INT (Fout * 2^32 / Fclk (DDS Clock))

Helps if you have a calculator that can perform binary, hexadecimal and
decimal conversions.

I agree with your comments and was in no way attempting to dissuade the gentleman from doing some honebrew. But, the question was "which homebrew?"

He asked about a very specific, complex transceiver designed probably 5-7 years ago and published in a book. Not a kit. Not even current. This would require obtaining all the parts, no PCB if I remember correctly, and all in all even if everything could be found for the construction, there is little or no assurance that the performance would be worth the cost, time and effort.

I suggested instead that he investigate the K2 by Elecraft is he really felt that he was up to tackling a fairly sophisticated transceiver. The K2 is not a kit for the absolute beginner, although some have succeeded, but I feel that he would have a much better chance of coming out with something really useful by going this way.

Folks, I started building my own station equipment back in 1946 and have been ever since. The soldering iron here seldom misses a day being hotted up! <:}

I was speaking more to the components that the design. It is
questionable if some of the components around which the design was made
are even available after such a time period. Yes, basic receiver design
was "solved" a lot longer than 30 years ago, but modern designs are much
more complex than in those days. And so are the components that are in
use.

And, as I recall from browsing the book in the store, not a great deal
is said about the performance that the project will yield upon
completion. I guess that I lost interest when I saw that the main tuning
dial was a coffee can lid and some rubber bands . . . nothing wrong with
being inventive, but there are far better ways to turn a shaft than
that.

Most amplifiers that can be adjusted, have a DC controll line.
The microcontroller would make a dc voltage/current with a Digital to analog converter.
This can be as simple as a collection of resistors of the right values connected to a parallel port.
The digital word describes the gain setting.

3128. EZNEC: Copyright Violation

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-21 00:00:00 UTC
From: fractenna@aol.com
Message-ID: <20001021084437.21694.00000832@ng-cd1.aol.com>
Source record: 57112

NOTICE:

Roy Lewallen, W7EL, d/b/a/ 'EZNEC' is in copyright violation for unauthorized distribution and publication of the antenna file marked 'MI2'. Lewallen has publicly made and advertised this file on his http://www.eznec,com web site. Furthermore he has publicly advertised its availability on USENET.

This MI2 file was first produced by me in 1994, with a revision in 1995. It's copyright was assigned to Fractal Antenna Systems, Inc. in 1995. The MI2 file posted by Lewallen is either an exact or "substantially recognizable" derivative of my copyright file. Lewallen has neither sought nor received permission to use this file in any way.

Mr. Lewallen's commercial publication and distribution of the MI2 file does not constitute "fair use" and he has been so advised.

On 20 October, 2000, the copyright for MI2 was transferred back to me, the author. I am the sole holder of said copyright and have not authorized any copies to be published or distributed by Mr. Lewallen. The file is not in the public domain.

I urge fellow amateurs to actively discourage Mr. Lewallen from unuathorized use of copyrighted material. To do so undermines the edifice of creativity which much of the software used by hams is built upon. Not only is it stealing, but it is an insult to those who try best to educate and help others.

Mr. Lewallen has been sent a certified letter formally asking him to cease and desist. If he does not remove the material he will be sued d/b/a EZNEC.

Please let Lewallen know how you feel about stealing someone else's property. His e-mail is:

w7el@eznec.com

Thank you!

Nathan Cohen, Ph.D. N1IR

Here's a dumb question concerning the AD9854:
I use this device at work and program it using Visual Basic. VB5 can only do
32-bit math. How do you program all 48 bits of this device? Lookup table?

Help !
I am fixing heater thermostat unit.
It has a 4W(maybe) resistor that apparently feeds the controller IC.

That resistor is marked BROWN, VIOLET, YELLOW and GOLD.
According to normal markings that would 170 Kohm. with 5% tolerance.
But in a working thermostat the measured resistance is 12 Kohm.

Can anyone help me to determine how these resistor-markings are coded ?

Regards
Mike

>varios IFs eg. 455 / 10.7 / 4.43
>any ideas ??
>thanks.....Peter

You want to look for RF sweep generator of FM IF generator in your search.
The term Wobbulator is out of date by about 50 years.
It was a means to produce frequency modulation by the use of a voltage
controlled
capacitor made of a speaker and one moving plate attached to the voice
coil. and a
fixed plate attached to the frame. Now that is done with a variable
capacitance diode.
I believe the term Wobbulator may still be used in some European countries.
Good luck

Mike:
According to the color code you posted, the 170K @ 5% should be the
resistance.
Did you measure the other resistor in the working thermostat "out of the
circuit?" Disconnect one of the legs of the resistor and try measuring it
again.

From: WB8RCR <wb8rcr@qsl.net>
Message-ID: <8ssgm701h84@news1.newsguy.com>
Source record: 57117

I think most folks just pick an IF they can buy crystals for cheap, then pick up an armload and match them themselves. While there are a number of sources for crystal filters, they are generally pretty expensive and generally not as flexible as rolling your own. You are going to make a tradeoff between the skirts, the ripple, and the insertion loss, if you do it yourself, you have unlimited choice in making that decision.

Of course, this generally leads to oddball IF's. If you absolutely have to have a 10.7 MHz IF (you may be planning to use a packaged IF system for example), then it could get expensive. But if you are willing to be flexible in the IF, you can generally pick up a couple dozen crystals for a fraction of the price of an already built filter. Of course, you have to go to the trouble of selecting them and doing the design, but in the end, you get exactly what you want for a fraction of the price.

Gentlemen,
My HP 608F VHF signal generator after sitting for about a year has developed pretty severe drift at the top end of it's range. I use it for maintaining my UHF repeater but it drifts off freq so fast it has become a PITA (Pain in the ..)

Anyone have any idea what may be going on here. My only tube experience is with Amplifiers. Every oscillator I ever built was Xtal ref PLL.

3135. Re: Power Resistor Markings

Hi,
I think I have figured it out.

The resistor marking is probably 4.7 Kohm (red->brown, violet, yellow,
gold)
Red has turned to brown due to heat.

4.7 Kohm is the recommended value in the application note for TDA1023
which is the control circuit used in this thermostat.

It seems that this resistor is under-rated powerwise.
I have found two thermostats with the same broken resistor.
It seems to degrade from 4.7 K -> 12 K -> infinite Kohm.

Two more ways to build the wobbulator;

Use a motor to drive a variable capacitor which is part of your tuned
circuit

Use a motor to drive a shorted turn in a coil. Put the
shorted turn at 45 degrees to the shaft and inside the coil.

Otherwise use the modern diode and transistor circuits.

George, I should have echoed your concern about that particular project. It does sound like a lot of work for perhaps a limited result (altho I haven't seen the particular article). But again, it sort of depends on the objective. Personally, I'm not a fan of pre-made PC boards, not enough room for artistic expression <g>.

I wouldn't be so concerned about collecting the parts. Although it's work, it's a lot easier today than it used to be. A visit to the web sites of DigiKey, Dan's, and radioshack.com will generally locate all the parts for most any QRP project. BG Micro and/or MECI may shave a few pennies off the cost, and if there's a tough part, it may take a visit to RF Parts, but it ain't like it used to be. Admittedly, getting big coil stock and transmitting caps for a QRO project can be a bit more of a challenge, to say nothing of the transformaer if it's a valve rig.

By the way, I noticed BG Micro has that 80C31. It's a whopping $2.49.

There are some very good suggestions in response to your question.
Another that comes to mind is a small, amplified binaural "listener"
from RadioShack.
The unit has two small mics, a volume control, and possibly a tone
control.

The user sits at their normal distance from the tv and uses a set of
stereo earphones (Walkman-style) to listen to the locally-amplified
sound.

Tv sound can be at a level comfortable for other people in the room
while the user with the mic unit can control his/her own volume.

The price, I recall, is around twenty to thirty dollars US, excluding
headphones.

Disclaimer: I am not employed by RadioShack.

There is also a spreadsheet, downloadable from my web site, which automates the formulae from the ARRL Handbook, and does a few other tricks besides.

What it won't do is decide what value of load impedance you want to present to the tube. For that, you need the Power Amplifiers chapter in *recent* ARRL Handbooks (editions before about 1995 used inexact formulae which are now superseded).

The spreadsheet is marked "under construction" but the workers have wandered off to dig holes somewhere else. If you can drive Excel with a stick shift, and use the ARRL Handbook as your road map, you'll probably get through OK.

Roy Lewallen is an honest person who has produced some excellent antenna
modelling software -- if no the top version, one of the best. I have
used
his software often. It helped me immensely when modeling a modified
telerana
for my shack. He owes no one -- especially N1NR -- any apologies. N1NR
owes
the various newsgroups (definitely rec.radio.amateur.antenna)he has
continously
spammed with his legal threats many apologies. If he responds to this
-- it
will be of no avail as I have already added him to my bozo-bin for this
group and
all other amatuer radio group I scan.

Thanks again, Roy, for a great software product.

Tony -- KF3BX

I think you are looking for an "H" bridge, a couple of pairs of
complimentary transistors that are biased to sink or source the load
depending on the polarity you want. Probably best to use use pulse width
modulation to adjust motor speed. Check out the "Nuts and Volts" (west
coast US electronic hobbyist magazine) web site (don't ask me, use a search
engine) for their robotics circuits. I have never built one, but have seen
them in the magazine often.

And, yes, I know that I also need a way to key the radio. I intend to install a second jack for this, with wires run to the mic switch inside the radio. That part should be no problem - its the microphone wiring that I have no experience with.

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-22 00:00:00 UTC
From: jwodell@provide.net
Message-ID: <39f23120.6262779@news.provide.net>
Source record: 57137

I am faced with a problem I've never come across:
I need to replace a ceramic in the output of a pi
network on a 500 watt amplifier.

The one that was in there was rated at 2 kv, but looked
like a rather overgrown ordinary ceramic.

I think my problem is that I don't know how much current
flows through such things. The thing is switched in
on 40 to make a large, 4-section variable work better.

Not too clear, but where does one get such things? Mouser
has them, and cheaply, but I'm from a generation when
big transmitting micas were used

73 jerry w8gnd (jwodell@ameritech.net)

3165. Re: EZNEC: Copyright Violation

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-22 00:00:00 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <39F2E20E.A5D56C06@eznec.com>
Source record: 57138

This whole business started on the rec.radio.amateur newsgroup. Chip (aka Dr. Nathan Cohen, Ph.D.) isn't getting any sympathy there, so I see he's taking it farther afield. Readers of that newsgroup who haven't put him into their kill files have been able to see the whole story develop, but for readers of this group who don't know the story, here's a brief synopsis.

On August 12, Chip made a posting on the rec.radio.amateur.antenna newsgroup offering $1000 for anyone who could submit a design for an antenna "which has a performance advantage over the MI2 fractal loop element". He referred to his web site for an example of the MI2, and required that all submissions be in the form of an EZNEC file. (EZNEC is antenna modeling software I develop and sell.) The posting includes an equation of several terms defining a "figure of merit" which must be beat. You can see the original posting at http://x67.deja.com/[ST_rn=ps]/getdoc.xp?AN=657467296&CONTEXT=972215956.414253064&hitnum=17.

In subsequent postings, Chip refused to provide an EZNEC file of the MI2 for challengers to compare with, unless they had signed up for, and were accepted to, his mailing list. He has a history of refusing admission to or removing people from the list who have disagreed with him, so several potential challengers were unable to get on the list to get the file. (Actually, I don't know of anyone who actually did get it.) I offered to post any submitted files on my web site http://eznec.com as a public service, so anyone could see for himself how various antennas compared, since Chip hadn't come forward with an offer to do so.

Steve Best, VE9SRB submitted several EZNEC files, which I posted as I had said I would, and with Steve's permission. (You can download them from ftp://eznec.com/pub/MI2. The file 0Notes.txt in that directory explains what each file is.) Among the files are one of the MI2 antenna which Steve created by measuring wire lengths from a picture of the antenna on Chip's web site, where he had directed challengers to look. Steve accompanied the EZNEC files with text files (same name but .txt extension) which explain about the models. In the text file accompanying the MI2 EZNEC file, he fully credits Chip for its design.

Rather than being pleased by this properly credited acknowledgement of his work, or address the issues raised by this response to his challenge, Chip then claimed that the MI2 EZNEC file Steve created infringes his copyright of an EZNEC file he created years ago and which neither Steve nor I has ever seen. (So far, I haven't located anyone else who has, either.) Chip sent me an email message requesting that I remove the file on the basis that it's infringing his copyright. I don't

believe there's any possibility it's infringing any copyright so refused. He's now threatening legal action, as he has with many people, but none has so far resulted. Fractenna (the company, of which Chip is president, which apparently owned the copyright until recently) apparently sees how foolhardy and pointless legal action would be, and has given the copyright to Chip. So now he's free to pursue it on his own, presumably with his own money.

I have very high respect for intellectual property, and indeed depend on other people's respect for it to make my living. If I thought for a moment that the file on my web site was infringing anyone's copyright, I would remove it immediately and issue an apology. But I see Chip's action as nothing but bullying, and I won't be bullied. So the file remains. I encourage anyone who's interested to read Chip's "challenge", and if you have EZNEC, to download the files and decide for yourself whether he owes Steve $1000. (Sorry, the files won't run on the EZNEC demo -- the full program is required.)

I apologize for the leakage from the antenna newsgroup of this bizarre matter. It's sad enough that we have to put up with it there.

3166. Tank circuit design for linear amp ???

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-22 00:00:00 UTC
From: Mike Tatum <miket@cybatek.fsnet.co.uk>
Message-ID: <39F2E179.EB0C9CB1@cybatek.fsnet.co.uk>
Source record: 57139

Hi Group!

A quick question for you.

How do I calculate the amount of inductance and capcitance I need for
the tank
circuit for my 2 x 813 valve amplifier to work on 160m ???

Obviously there is a tune and load variable capacitor plus some fixed
amount plus the large inductor,
but how do I calculate this ?

I will be feeding the valves with 2.8kv and only want the amp to work on
160m.

Please reply to group and directly to me as the news server here isn't
too reliable!

Cheers and beers!

3167. Gel Cell Charger Project Details Now Online

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-22 00:00:00 UTC
From: vk3em@hotmail.COM
Message-ID: <LAW2-F167FmWAFsTmIC00001978@hotmail.com>
Source record: 57140

G'day all from VK,

I have now finished the VK3EM Sealed Lead Acid Battery
Charger MkII. In the interests of others I have documented
everything (well everything relevent) in a 26 page project
manual. The project is about constructing a quality
gel cell charger (well, something better than just a
power supply set to 13v8).

The project notes(available in PDF format) contain
everything from design documentation, to construction notes,
testing notes, schematics, PCB layout, bill of materials,
etc. I am treating this work as "Open Harware", that means
your free to do anything with it providing it has no
financial gain.

I would like to turn it into a proper kit, but don't have
the time myself. If your interested, let me know.

Since a few members from my radio club wanted a charger,
I had 40 PCB's made. I have a few left over and they are
available for a nominal cover charge and shipping.

Please note : If you couldn't construct the SMK-1
(Norcal surface mount radio kit) then this project
will not be suitable. I use 0805 and 1206 sized
surface mount as well as regular leaded parts.

Don't depair if you can't handle surface mount. There
is enough info available to construct your own PCB
or even mock it up using ugly construction or a vero
board.

The relevent URL is :

http://www.geocities.com/vk3em/sla-charger/sla-charger.html

Thanks for listening.
Comments Welcome.

This information has been in the ARRL handbook since forever and I am quite certain it is the RSGB handbook as well although I don't have a current one on hand to check. It would make a lot better sense to look it up than to beat the subject to death here. If you still have questions after checking the handbooks, do feel free to air them here.

Good luck with your project.

I am in need of a circuit that can use a Microcontroller to control the polarity of the supply to a Permanent Magnet DC motor.

6-12VDC
1-3 Amps

Very broad specs on such a circuit, anything that is anywhere in the ballpark will do too.

Awaiting your replies.

What type of DAC would you suggest?

I had a bit of a read and it says to adjust the Gate voltage to control the output...

Would anybody have a project that does use a DAC to do this?

>Most amplifiers that can be adjusted, have a DC controll line.
>The microcontroller would make a dc voltage/current with a Digital to analog
>converter.
>This can be as simple as a collection of resistors of the right values
>connected to a parallel port.
>The digital word describes the gain setting.

3176. Adding a mic jack to a HH radio??

Hi Peter,

I've built a basic (but useful) wobbulator using the VCO from a 4046 pll and a 555 timer. The 555 generates a ramp waveform, which is buffered and level shifted. The ramp is fed into the control voltage of the 4046. The 4046 has switchable capacitors and pots for determining range and end frequencies.
I've used this for measuring bandwidths on filters, and with a mixer/filter/detector as a crude spectrum analyser.
If you would like more info, even a scan of the hand drawn schematic, please ask.

James.

Hello,

I would like to design my own crystal IF filters, is there a design guide available on the net on how to do this? I've seen a few ready rolled ones, but would like a custom design for parameters that I want.

James.

Dear Mark,

Hahahahahahahahahahahahahah!!!

Thanks for the commentary, I laughed my butt off.

I've been on this NG for over a year now and Roy has answered many questions. He has been beneficial to my personal development as a ham and a good source of information and not once do I recall him clogging up this or any other NG with a bunch of spamming clap trap about how someone pirated from him (which in his line of work I'm sure happens all the time, he just has the good grace to keep it out of the NG).

If my Elmer where here I'm sure he'd say something like

"what a whiny little bitch. . . . pardon my french".

in response to Chip's childishness.

eBay is a great place for stuff like this. I've bought 4 or 5 sealed
packages of 25 varactors of various types there.

Pulling the knob out just closes the output circuit. You need to get in there and troubleshoot it, starting with the power supply. Is there +5 Volts coming out of the regulator?

Well, you can't fault Chip on that one. If a file is copyrighted and
you distribute it via your web page or any other means then YOU are in
violation. It makes no difference that you got the illegal copy from a
third party.

I agree entirely with Bob about copyright and distribution. What I have on my site is an EZNEC file created by Steve Best. I have his express permission to post it on my site. To the extent that such a file can be copyrighted, Steve, not Chip, owns the copyright. Because Chip does not own the copyright for this file, he has no right to determine who may post or copy it.

I have built several but I never had problems running a motor.
Regardless, you might try adding a hash filter to the output. Use a pi
network, and start with about 3uF across the transformer, a series
choke of about 10uH, and an output cap of 0.25uF. This may change the
frequency because of the additional load.

Another method would be to use a 60Hz oscillator, filter for a sine
wave, and amplify. Very troublesome.

Sparky

Frank,

The first thing I would go after is to check that the power supply is
stable.
Then I would
see if one of the frequency-determining components or a decoupling cap
might
have failed. Is the frequency drift associated with a particular band
switch
setting?

Try the TAP 2.0 freeware program located on my site at;

http://sites.netscape.net/kd9jq/hamradio/TAP.html

It calculates Input/Output circuits for G.G. Triode RF Amps.
I don't have th 813 listed but you should be able to generate
a file for it using the included utility. You will need the tube
characteristic curves.

my wife & i are travellers in outback Australia.Im looking for a MOBILE TS50'S,IC706,OR codan 8528 so i can enjoy my hobby while im away touring.I know there are great mobiles round in shacks just collecting dust.
I would like to swap my TS440SAT [complete station] +/- CASH for the mobile.The 440 has NEVER been outside my house since NEW,there are No mods done other than kenwood approved mods done by kenwood agents [RX 30KHz to 30 MHz - TX 1600KHz to 30 MHz cont @ 100w [slightly less on 10 meters].LOOKS 9.5 runs ABSOLUTELY 10.I DONT want to drag the 440 through the outback as its not designed for it where as a mobile is.
ANY inspection is welcomed the radio is ex condition,cheers rod VK4XI.

So this claim is that the description file was reverse engineered from
the actual design.

On 23 Oct 2000 02:18:15 GMT, fractenna@aol.com (Fractenna) wrote:

>THIS IS A COPYRIGHT FILE owned by me. IT IS ILLEGAL to publish, distribute and
>copy this FILE from the EZNEC web site.

If that file really was created by reverse engineering an existing
sample of the original design (and you do not seem to refute it), I do
not see how you can claim copyright to that file no matter how many
time you repeat it.

This is like an architect threatening to sue every painter who paints
a picture of a house designed by the architect.

The thing is different if you can show that the file is a direct copy
of your original design file and that the dimensions were not obtained
by reverse engineering.

If that design is patented, then this prevents the unauthorised
commercial exploitation of the design, but even in this case the
granted patent should be detailed enough, so that a skilled person can
reconstruct it and verify the claims.

Cheap options in 2000 are a Baycom-style modem (use the updated
MX614 design, please - TCM3105 is long obsolete), or a sound
card in your computer. Both are cheap. Both work well.

You might also make inquiries among local hams, snoop around
EBay, etc. for something cheap to get you going.

3208. Ten-Tec 6M Transverter Performance?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-23 00:00:00 UTC
From: Paul Knight <paul.knight@prairiecomm.com>
Message-ID: <8t1n0dbum1@news.enteract.com>
Source record: 57079
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hello! I've heard lots of good things about the Ten-Tec transverters for 6M. I dug up QST review on the kit, and was startled to see a noise figure measured at 7 dB! Is this a typo? Has anyone confirmed a number like that? If that is the case, it seems like it would be a great unit for casual use, but not really for more serious 6M work.

It's a longshot, but has anyone attempted any mods to it to lower the noise figure?

Thanks,

Paul WD8DKY

3209. Re: Ten-Tec 6M Transverter Performance?

I reduced the noise figure on my 10m-2m ten-tec by about 6dB. I replaced the 1N914 diode ring mixer with good Shottky diodes. I tried it on my 20M-6M ten-tec and got about 2 dB improvement. They seem to work OK. A good Ga-As FET pre-amp without an excessive amount of gain (output padded down) improved my noise figure too.

My LO xtal seems to drift quite bad. I haven't tried to cure that one yet.

Any reverse-biased diode will exhibit voltage-variable
capacitance - I've used 1N914s as varactors, for example.
It's only when you want well-specced capacitance or a
large capacitance swing that you start looking for "real"
varactor diodes.

I just tried several Internet suppliers and every one that
carries RF stuff has varactor diodes. Digi-Key, to pick
one at random, have stacks of them...

Thanks to the dozens who responded. I asked about such a
socket a few weeks ago and got zip for response and thought
they must have gotten rare! I guess "Drake" was the keyword
to explain what I was looking for.
FYI, Digi-Key stocks them, but says supply (160 in stock) is
limited. Mouser says they are discontinued.

Generally look for the BB series for high Q vco operation parallel up 5
or 10 UHF varicaps to lower series R and inductance.
Also instead of using very expensive MV series large capacitance use the
miller effect for medium waye frequencies ie UHF varicap across base
collector.

Sorry, Cirkit are no longer doing catalogue sales to amateurs (I asked them a few weeks ago in connection with a magazine article).

Try www.bec.co.uk - as well as being the main UK importers for TOKO products, BEC (formerly Bonex) do quite a lot of the old Cirkit lines. They are good to deal with by mail order.

I have a Stancor modulation transformer A-3893 and need information on the primary and secondary connections. Each side is brought out on soldering lugs marked 1 thru 6, and 7 thru 12.

I would also appreciate help from anyone who's done the modulation upgrades on their Viking Ranger using this transformer.

This is not uncommon for a transverter. If you really need a better
noise figure, you should be using an external pre-amplifier close to
the antenna. Why destroy the dynamic range of your transverter by
installing a pre-amp there, after you've suffered all those
transmission line losses?

And in any case, the transverter only puts out ten watts. You'll
probably want some sort of tower mounted PA/preamp for serious DX
work.

: any ideas ??

One of the simplest/cheapest ideas I've ever seen was in a 1950's Weston sweeper - they modulated the frequency with a speaker cone connected to a piece of metal in close proximity to the tank coil. 6.3VAC thru a rheostat to the speaker voice coil set the frequency swing and also supplied horizontal sweep sync to the scope.

Interesting product line...

The other question that comes immediately to mind: why not
consider other ways of generating SSB? Crystal filters are
hard to get, and they're expensive.

We have options: all-pass filters built with op amps and
off-the-shelf 1% components are cost-effective and work
well. Similarly polyphase networks - high parts count, but
the parts are cheap. How about a Weaver exciter with
switched capacitor filters?

DSP is a nice option for such applications. A DSP eval
board won't cost much more than a crystal filter, will
produce far superior signals, and, best of all, you can
actually *buy* the things...

Am I to assume that you already have the proper license,
radio transceiver, antenna, etc..? There may be more
to it than you think. If you don't already have the license
check out "http://www.arrl.org/hamradio.html". This will give
you the scoop on obtaining a license and give you an overview
of amateur radio.

A better news group to pose your question about a TNC would
be the "rec.radio.amateur.digital.misc" news group. I read
it regularly and it has a lot of information available. The
only TNC you may need is some software and and the computer
that you are reading this news group on.

The figure may seem high in comparison to the low noise figures that you see advertised and claimed. The high ambient noise on 6 meters, both man made and atmospheric make the need for low noise figures on six a moot point. You would hear just fine with a 7 dB noise figure.

Hi gang,
I'm looking to build a low power (<10W) 13.8 VDC to 120 VAC inverter
to run a small 120VAC syncronous motor. I would really like to use a
120V/10V transformer in reverse and drive it with some kind of simple
switching circuit. Everything I have tryed yields a >very< distorted
and spikey waveform. Needless to say, the motor does not react well to
this. :(
Any ideas? Anyone done this using such a transformer?
Thanks!

3227. PIRACY by W7EL--EZNEC

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-23 02:18:15 UTC
From: fractenna@aol.com
Message-ID: <20001022221815.20675.00000971@ng-cu1.aol.com>
Source record: 57060
Body handling: HTML body converted to readable text

<>

Incorrect Mr. Lewallen. Remember that this public notice will be admissible in a court of law.

<>

This much is correct.

<>

That is absolutely incorrect.

Since 1996, I have provided OVER 200 copies of the MI2 file. My requirement has been that the file be for personal experimental use and not be distributed. The copyright must be used and attributed.

Here are some places I have offered and sent files in response to:

rec.radio.amateur.antenna
antennas@qth.net
NEC-LIST
fractalaantenna@egroups.com

Because of the extraordinary harassment, I have , in the last six months, restricted distribution of the file to those who are members of the fractalantenna@egroups.com reflector. Anyone can join and anyone can request and receive the file--SUBJECT to the above requirement. EVEN NOW, as before, ANYONE can receive the file under the aegis of restricted distribution, copyright acknowlegdment, and the above rules.

AT NO TIME HAVE I NOT honored a request to provide the file subject to the above. AT NO TIME HAVE I IMPEDED comparison, scientific evaluation, or legitimate access to the file SUBJECT TO THE ABOVE.

<>

NOT to me!

<< which I posted as I had said I would, and with Steve's permission. (You can download them from ftp://eznec.com/pub/MI2. The file 0Notes.txt in that directory explains what each file is.) Among the files are one of the MI2 antenna which Steve created by measuring wire lengths from a picture of the antenna on Chip's web site, where he had directed challengers to look. Steve accompanied the EZNEC files with text files (same name but .txt extension) which explain about the models. In the text file accompanying the MI2 EZNEC file, he fully credits Chip for its design.>>

THIS IS A COPYRIGHT FILE owned by me. IT IS ILLEGAL to publish, distribute and copy this FILE from the EZNEC web site.

<>

This is an illegal publication and ditribution of a copyright file.

<< Chip sent me an email message requesting that I remove the file on the basis that it's infringing his copyright. I don't believe there's any possibility it's infringing any copyright so refused.>>

You are infringing on copyright Mr. Lewallen .

<>

I am not threatening, I am proceeding. The public needs to be on notice that you are a pirate who is ILLEGALLY distributing copyrighted materials for which you neither own nor have permission to distribute nor publish.

I am not a president of any company, and I know of no company named 'fractenna'.

<>

This is another extraordinary statement which will be admissible in a court of law.

I asked, and was granted, transfer of copyright. It was purely my initiative and request, with no discussion whatsoever along the lines you discuss.

<>

YOU NEED TO REMOVE THE FILE. It is illegal to distribute and publish this file by you.

<<. But I see Chip's action as nothing but bullying, and I won't be bullied. So the file remains. I encourage anyone who's interested to read Chip's "challenge", and if you have EZNEC, to download the files and decide for yourself whether he owes Steve $1000. (Sorry, the files won't run on the EZNEC demo -- the full program is required.)

I apologize for the leakage from the antenna newsgroup of this bizarre matter. It's sad enough that we have to put up with it there.

Roy Lewallen, W7EL>>

I will continue to promulgate public notices describing your piracy, as the legal affair proceeds.

Nathan Cohen, Ph.D.

Hi Peter,
I'll get a scan done over the next few days, and put some info and the scan
on my web site. I'll then post the URL.
James.

Hi All

I did mean the AD9754 and concede that it is indeed a DAC. Perhaps the 9854 is better for me; am downloading the datasheet now.

I think that I am missing some very basic point about the 9754; perhaps I have an incomplete datasheet. I can't see how to set the frequency tuning word? Hope I'm not displaying how silly I am!

Thanks for the replies posted so far.

regards ... David

>
>jim K4KAE
>
That's absolutely correct. If you improve the noise figure, you won't
hear any better because the *system* noise level is determined mostly by
external noise.

A preamplifier would also be a bad idea because it adds gain, which
subtracts directly from the strong-signal handling - you may end up
hearing *less*, not more.

Note: this is the situation on 6m. On 2m the external noise level is
less, so the optimum NF is lower. On 70cm it's different again.

If you already have a favorive radio. The Palomar converter, 0-500KHz, may be your best bet. 2 models, up up converts to 3-3.5 Mhz and the other converts to 3.5-4MHz. About $90.00US.

get the manual and schematic I will go a bit further. Thank you for
your reply.

I did notice that the output transistor does get hot when I leave the
knob pulled out. I was suspicious of that particular pot as the keyer
was put in a dirty, dusty environment for 16 years.

I'll let you know how I do....the good news is that my HW-8 is working
fine, just needed a bit of alignment. Got an antenna, the rig, now I've
got to get the keyer up and running.

Pulling the knob out does a little more than closing the output circuit. The switch from this knob is across the "Ext. Key" input and grounds the input to a 3-input NAND gate. The output of this gate is used as feedback to the dot/dash latches and drives the keying transistors and the sidetone oscillator. If the sidetone is working, I would not initially suspect the +5 Volt power, although I would, without a doubt, check it.

If you want to get a head start on trouble shooting, you can download a copy of the schematic from:

The Boat Anchor Manual Archive
http://bama.sbc.edu/heath.htm

or

The Heathkit Ham Radio Pages of KB9JJA
http://members.accessus.net/~dwentz/kb9jja/heathkit/

On the Heathkit site also pull down the Service Bullitin for the HD-1410. It's a text file that, among other things, contains a step-by-setp trouble shooting procedure.

I found that speed resolution in the 10 to 20 WPM range for the HD-1410 was poor, so I soldered a 15K 1/4 W resistor across the 50K Speed control. This reduced the maximum speed but smoothed out the control setting in the low speed ranges.

Good Luck

There is no frequency tuning word. You must generate samples
of the waveform yourself, by whatever means you have at your
disposal, and apply the samples to the DAC. In return it will
make whatever noises you want - not just sine waves.

Hi Dan,

If you can't find one for sale or if you find a very expensive one you might try this

http://www.thebizlink.com/am/tech/htm/tvtomod.htm

It shows how to modify a power transformer into a modulation transformer. I have not tried it but I've heard it works well.

Good Luck

The following will get you the construction manual:

http://www.fix.net/~jparker/norcal/articles/38sccm.htm

You can obtain the schematic/parts list at:

http://www.fix.net/~jparker/38spcl.htm

However, it's going to be tough to get a copy of the PCB. You
may try emailing some of the guys that created the web page.
They may be able to email you a copy.

Good Luck

> quite expensive and in SOT-23 etc packages.

You must pay what the distributors want for them, or do without.
Is 50 cents expensive? You might also consider joining the 21st
century and adopting modern device packaging. SMD is useful -
and when you can make a VFO the size of a postage stamp, all
sorts of neat things happen.

> I am looking for varactors for VFO purposes and the cost needs to be
> significantly cheaper than an air variable cap to justify their usage.

The most expensive varactor I could find at Digikey was $US3.39
(ZC394TA). Lots of other useful devices are in the sub-$US1.00
range in onesies and twosies. This is expensive?

Availability is an issue too. The perceived cost of air variable
capacitors is irrelevant if you cannot obtain them.

Digikey is not the only supplier. I just mentioned them as an
accessible, ubiquitous supplier who have product and can ship.
There are lots of others, and if you got your head out of the
sand you would know about them. I use an outfit in Holland a
lot these days who are not the cheapest, but they have just
about everything you could want, and have an excellent Web-based
order system. A great way to spend vast sums of money. :-)

> The MV104, MV2301 etc are what I have in mind.

Then buy them. They're available. But insulting people is a
lousy way of finding leads to suppliers.

> My thanks and best regards to all of you

You're kidding, right? Since when do personal insults constitute
"best regards"?

Hi Ed,

It's me again.

That output transistor WILL get hot when you keep the unit keyed.
Normally it is running at much less than 50% duty cycle an thus
doesn't cause a problem. I thing your biggest problem is going
to be dirt.

Further, on the HW-8 (I have one of those too), check out the
internal key connections. If it is unmodified, the key jack is
isolated from ground and wired backwards. If the HD-1410 and
the HW-8 share the same ground, you will have a problem keying
it.

If you need some more info on the HW-8 I have several PDF files
I made, that you may be interested in. Two are collections of
modifications (200K and 500K) and one is on the core heating
problem (100K). Let me know if you want them and I will
email them to you.

>
Martin, the biggest problem IS dirt.....maybe I should start by just giving the board a good cleaning. Thankfully, the HW8 is clean. I never had problems with this combination before.....but I will be on the lookout.

I printed out the files you suggested...thank you in particular for the Bulletin tip....the check-out procedures in fact have a sub-heading for my problem and they suggest it is Q2.....

I would very much like a copy of those files. I am looking forward to doing some mods..esp an SWR bridge as suggested by Ade Weiss in 1978.

It's fairly pathetic thats for sure. I've seen alot of goofballs in my
43 years on this planet, but he takes the prize. BTW, I deleted my
original posts after a few hours yesterday. I just wanted to make sure
he saw them, and then I took them off. No reason to ruin this fine NG
with all this. The little turd has already ruined the antenna NG. Might
as well try to keep it there. MK

Hi Reg,

The tubes will be in parallel, according to some info I have here it
talks of 1.2kw from two
813 valves, but I will only be looking for 400w max as that's the legal
limit here in the dinky UK :)

Maybe you missed it the first time:
Look at this schematic:
http://www.qsl.net/we6w/projects/pixie2.gif
it's for a little QRP radio, but it uses a LM386 for the audio. Just duplicate the circuit for the LM386 portion. If you do a search for LM386 on the web you'll probably turn up some other schematics as well.

3249. Re: DC to AC inverter

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-24 00:00:00 UTC
From: ZL4PY <ZL4PY@mail.com>
Message-ID: <39f5f1a4@clear.net.nz>
Source record: 56982

For low power applications you can use a common car audio chip and put the transformer in place of the speaker. Then you will get out whatever waveform shape and frequency you feed in to the amp chip. A 555 timer astable osc can be used to generate the 60Hz but for best accuracy you should divide down from a crystal then filter the final waveform to be an approximate sinewave or at least round off the square edges of the square wave.

I am running a 50Hz low power synchronised motor drive system at this time using the simple 5-pin audio device TDA2003 (10W). You can also use the twin version TDA2005 (20W) which is configured for single waveform input although it gives H output.

As for transformers, I am using a $2.50 standard industry 10W line output matching transformer such as are commonly used for mutilple speaker systems as in public buildings etc. Run backwards these provide 70 and 100 volt line outputs from multiple tap low impedance inputs typically 4, 8, 16 ohms. You just select the taps which give you what you want.

In addition to controlling the gain of the audio chip, you can also sample the output with zeners, and feed it back to the base of a BC548 (or any similar) which is connected straight across the low signal input of the chip. This automatically limits the input signal amplitude so that you always get the output voltage you want for varying loads.

>Can anyone help me to determine how these resistor-markings are coded ?
>Mike

170k isn't a likely value. Assuming a 120V supply (are you in the
US?) a 170k would dissipate 0.08 W. No point in fitting a high
wattage one. 12K ohms makes much more sense (1.2W).
170k isn't a standard value either, it would be 150k or 180k.

Sometimes the colours change with time or with heating. 12k would be
brown-red-orange-gold which is sorta close. ;-)

I am sorry to have offended you and realize "gentlemen"
was a bad word to use since it implies that I am ignoring your posting as a
female. I assure you it was not intentional and possibly the product of a 14
hour work day. I did not even look at the gender of those who replied. It was
my mistake and I am sorry to have offended you.

I was sincere in all of my comments.

My projects are very low cost and that is a priority.
Considering the price issue from Digi-Key. You may need 2 to 4 of an article
which are subject to exchange, duty and shipping and the cost may be magnified
greatly. I have no trouble getting air variables except for the cost.

Many people stay clear of homebrewing because of surface-mount technology
or even ICs because of unfamiliarity and intimidation in their perspective.
I do not wish to debate these issues.

The question was simply sources of varactors.

I am very grateful for your comments and have located a couple of
of suppliers based upon your posting. I am assuming the "gentlemen" is what
offended you and again apologize as it was a mistake.

> > special I should know before trying
> > this?

Hey guys, this turned out to be a lot easier than I ever imagined. After I took the main board out, and flipped it over, there were clearly marked locations on the board for external microphone jacks. All I had to do was remove a short wire jumper, solder in the jacks, and it works perfectly. In fact, there were even small indentions on the inside of the case where the holes should be for the microphone jacks to fit through. The whole job took about an hour.

I feel kind of cheated. I was looking forward to playing around with this experiment. It was too easy - it took all the fun out of it. Oh well, now I'll have to find something else to do.

Anyway, thanks for all the input, guys (even though everybody sent email insteading of responding in the newsgroup).

Dwight Stewart (W5NET)

Many thanks for your help gentlemen. I am well aware that
almost any PN junction will exhibit reverse-voltage variable capacitance
and am writing a web page to this effect for my site. However, I am looking
for sources of varactors for completeness sake in my varactor section.

I looked in Digi-Key and indeed they have them, but they are quite expensive
and in SOT-23 etc packages.

I am looking for varactors for VFO purposes and the cost needs to be
significantly cheaper than an air variable cap to justify their usage.

The MV104, MV2301 etc are what I have in mind.

My thanks and best regards to all of you

From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <8t2lfi$d7m$1@plutonium.btinternet.com>
Source record: 56961

Not such a quick question. Are the pair of 813's in
parallel or push-pull ?

If in push-pull you can't have tune and load capacitors. The
tank coil will be centre-tapped with the centre tap
connected to HT+ and the tuning capacitor straight across
the coil. The tuning capacitor may be 1 or 2 gang. Tx
output will be via a link coupling coil over the centre of
the tank coil.

If in parallel you may then have a Pi output circuit with
tune and load capacitors.

Please state whether parallel or push-pull and the expected
RF power output. Then the L and C values can be calculated.

HELP !!! I really need help finding a 50 to 100 watt modulation transformer that is multitapped. It is for a homebrew rig that I am building for 10 meters. The bigger the better as I want this rig to look as crude as can be with a lot of iron setting on it. I already have a 10 henry filter choke @ 500 mills. Also can anyone verify what I was told? I was told that I could use this huge 115 vac 1:1 isolation transformer for a modulation transformer.

It has a 500 va rating and I will only be running around 350 volts max through it.

If anyone does have a multitapped modulation transformer I prefer one that has the terminals or posts on it.

Thanks all,

73

Judd,

Can't speak for the QRP kits, but I purchased and assembled a 1220 2m
tranceiver kit and found it to be of very high quality. The assembly
instructions were very clear, and done in stages, with each stage being tested
before proceeding. The end result was very satisfactory and comparable to
commercial units at four times the price.

When I had questions, the folks at TenTec were very helpful. I'd recommend
their products to anyone.

What colour are your chokes? I took some light blue rf chokes out
of old vcr's and measured them. The colour code seems to be the
same as in resistors, and gives the inductance in microhenries.

3265. UC3906 based charger concerns

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-25 00:00:00 UTC
From: Bob Lewis <rlewis@staffnet.com>
Message-ID: <%RDJ5.696$5w5.332@newsfeed.slurp.net>
Source record: 56998

I word of caution about UC3906 based gel cell chargers and QRP rigs. The UC3906 chip will not come out of the bulk charge mode if there is a load of about 30 mA or more connected to the battery. This is because the UC3906 senses current draw to determine when the battery is fully charged. If a load is drawing current then the chip thinks the battery is not yet charged and so it never switches to float mode. If your load is equal to or greater than the bulk charge rate then it's no problem - all the charger current is going to the load. If however, the load is less than the bulk charge rate then the battery is receiving some charge and there is a potential for overcharging. QRP rig receiver currents are generally in the range that can cause overcharging problems.

I am working on a pulse-width type charging circuit in order to avoid this problem.

3266. FS: Heath HW-16 Xcvr

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-25 00:00:00 UTC
From: Walter Treftz <boomer1@hitter.net>
Message-ID: <39F7132A.57F6A4B6@hitter.net>
Source record: 56999

FOR SALE

Heath HW-16 QRP transceiver. Excellent physical
condx., all tubes, original knobs, etc. No scratches,
nicks, dents, rust.
"Might" have original manual (its from an estate
and thought I'd seen a manual drifting around the
club storeroom).
$75.00 plus shipping
No charge for packing (assuming we can find a
suitable box) and taking to USPO/UPS (your choice).
If not happy with it, return for full refund.
Located in central Florida.

Use a 555 as a square wave oscillator, a low pass filter to derive a nice sine wave, and then an single chip or boombox amplifier to drive the transformer. You could do the same thing with those 400 Hz mil surplus transformers.

In the days of glowing 6L6's we used MacIntosh or Bogen amps in the Lab to drive devices independent of the mains where high purity sine waves were required.

ZL4PY wrote:

3270. Hadn't seen this regulator before

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-25 00:00:00 UTC
From: JW <jdwalton@home.com>
Message-ID: <39F74635.9EB2CD64@home.com>
Source record: 57003

My son brought a broken gyroscope in this morning (actually a banking indicator from a Cessna). It had a TL7810 regulator for the motor! Put out a nice 10.22Volts. First time I had seen a 78XX in this voltage.

Unfortunately, the gyro motor was shot so it looks like a rebuild at Teterboro.

They exist in 8, 9, 10, 12, 15, 18, and 24 volts. Not all manufacturers
seem to produce all voltages, though.

Reg,

Firstly let me say "Thanks!" for your help and information!
This has to be the most informative news group I have _ever_ used!

I am chasing a copy of the ARRL hand book, but to date no luck,
hopefully
I'll stumble across a copy at the Picketts Lock rally!

I'm getting closer and closer to getting this amp built and going, which
without the help
of yourself and others wouldn't be possible!

Once again many thanks, and if I get stuck I'll drop you a line!

Cheers and beers OM would be great to catch you on 160m sometime!

Source record: 57008

Hi again Reg!

Just to let you know that I have found a source for the two variable capacitors
and indeed they are bought and paid for, 200pf & 500pf 6kv airspaced variable caps
from a well known UK linear amp manufacturer!
I couldn't shift up to 40m, I like 160m too much :)

I will be having a go at winding the 37uh inductor this weekend, I have written
a spreadsheet that will give me the information required based on coil diameter,
wire diameter and former length. Should be fun!!

I assume that working on an operating freq of 1.9mhz, the amp will be tunable on
the 1.81 -> 1.85mhz part of the band since above 1.850mhz we are only allowed to operate
at around 30w ?

Cheers!

3276. Goniometer

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-25 00:00:00 UTC
From: JW <jdwalton@home.com>
Message-ID: <39F77D9E.CF652DDC@home.com>
Source record: 57009

Looking through my 1993 Handbook, I find a picture of a goniometer in the monitoring and RDF section.

It really doesn't look like a medical device after all.

What was the XYL complaining about anyway????? Can't hear her over the QRM.

3277. WTD: EXAR XR-2208 chips

Hello--
I found a 78L02A (TO-92 package in a batch of components-- it's delivering 2.5 volts.

Mine works great but in the beginning had TOO much gain for the IC-245 I use it with. Detuning the front end brought it down to an acceptable level and lowered the perceived noise level also. Your milage may vary.
Paul

Don't forget the venerable 7805. :-) I have a few 7806'es, too.

3283. A Question of Distance

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-25 00:00:00 UTC
From: Ron Hubbard <hubbard_ron@hotmail.com>
Message-ID: <8t8f2f$mbk6n$1@ID-43450.news.dfncis.de>
Source record: 57016

I have rigged a 16 MHz clock oscillator with a rod antenna to test the sensitivity of some field strength meters. These little beasties do not radiate very far, and that has gotten me wondering about power output versus distance.

Does anyone know the factors involved and how to calculate how far an oscillator will radiate a signal?

Thanks.

Kenwood TS-520S in good condition with copy of manual. $275 plus shipping
from southern California.

This is a nice rig, about the most popular ever made. Puts out 100 Watts on
160-80-40-20-15-10 meters. Has SSB and CW.

If interested, leave email or call me between noon and midnight Pacific time
at 818-894-2887.

73, Bob K6DDX

Apology accepted. I would have preferred to respond privately,
but anti-spam email addresses make that difficult. :-(

> My projects are very low cost and that is a priority...

It always is. How much would you like to pay for varactor diodes?
Cheap is good, but how cheap is cheap? How cheap do they need
to be before they become interesting? How much are you
accustomed to paying for variable capacitors?

> Many people stay clear of homebrewing because of surface-mount
> technology or even ICs because of unfamiliarity and intimidation

Hi.

I'm trying to learn about Monopole or Marconi Antenna, but I haven't found so much information yet. I want to know about "radiation pattern", "ray angle", "directivity", "gain", "radiation efficiency", "efective area", "ray efficiency", "aperture efficiency", "radiation resistance", "bandwidth", "quality factor", "antenna resolution", "polarization".

Where I can find information about equations and all this stuff in the web ?

Thanks.

Sine wave at this power should be no problem. A Small amp fed with a sinewave osc feeding a reverse connected filament transformer. I did something like this about 30 years ago to drive a clock motor for a telescope mount. The motor worked fine. The mount tracked terribly.

3289. Re: Tank circuit design for linear amp ???

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-25 02:56:14 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <8t5j3j$39h$1@plutonium.btinternet.com>
Source record: 56994

OK Mike, we now have the info needed to calculate L and C component values for the Pi-tank network to match to 50 ohms. The values are not critical. +/- 20% are good enough considering both capacitors are variable.

With a DC supply voltage of 2.8 KV we will assume the peak anode signal voltage is 2200 volts. Rms = 1556 volts.

Also assume the RF power output is 600 watts on the 160 metre band, 1.9 MHz. This is a reasonable operating margin above the UK licensing limitation of 400 watts peak power. For higher powers, at your HT volts, bigger values of C and a smaller value of L will be needed.

So the anode (plate for US readers) load resistance is rms volts squared divided by power output in watts. The anode load resistance, therefore, must be 4035 ohms, give or take 10 percent.

The Pi-tank network, therefore, has to match a resistive 4035 ohms to a resistive 50 ohms at 1.9 MHz. This is not a very difficult arithmetical operation but for convenience use program TPINET to calculate the L and C component values to match 4035 to 50 ohms. There are a range of values which will do this with only a change in phase shift through the network so choose those which give a convenient bandwidth or suitable values of network operating Q. A Q of 5 to 10 is satisfactory.

I've done it for you :- Connect an RF choke between anode and HT supply. Connect a 200 or 250 pF max tuning capacitor between anode and ground. Connect a 37 microhenry coil between anode and the coaxial output socket. Don't forget a DC blocking capacitor in series with the coil. Connect a 500pF max variable loading capacitor across the coaxial output socket. Connect an RF choke across the output socket as a safety precaution. We don't want nearly 3KV DC on the antenna, do we ?

The main problem will be obtaining 200 and 500pF, air spaced, high-voltage, 6KV, variable capacitors. Do what the Americans do and shift up to the 40m bamd.

This sort of information is available in the ARRL (bible) Handbook. But, obviously, this is not available to you or you would not have enquired via this newsgroup.

Use program SOLNOID2 to design the 37 microhenry coil.

If you get stuck please come back again.

> allowed to operate
> at around 30w ?
========================

The pi-net values were calculated for 600 watts at mid-band 1.9 MHz.

Optimum C settings at 400 watts will be somewhat smaller and optimum L will be somewhat larger than 37 uH.

Furthermore, at 30 watts output, for high efficiency the coil could have an even higher inductance. Think in terms of 50 or 60 uH max but adjustable by tapping turns. On the other hand who cares about efficiency when Pout is only 30 watts from a pair of 813's ? ;o)

If you've been brought up on transistors don't forget 3KV is lethal.

>exciters ? Freq (i.e. 9.000 MHz or 10.700 MHz) is not
>so important as the actual availability of the parts.

Someone mentioned using ceramic filters which is
fine, but the skirts on 99 percent of ceramic filters
with 9-11 elements are disappointing, to say the least.
I have had some luck cascading 2, 3, 4 and 5 element
ceramics at 455. Results usually better than one 9-11
element filter. Cheap too.
Sometimes use a unity gain block at the end to overcome
insertion loss.

Good luck

I built the 1254 SW rcvr and love it. The instructions were clear each
section was tested. and when I lost a small knob they gave me a
replacement no cost! Great people to deal with (of course it dosen't
hirt that their 35 miles away!)

I have some 78L82's that I got at a surplus store and the bin was labelled
8.2volts. And some 78L62's that I got at the same time, likewise described
as 6.2volt regulators. I can't remember using any of them to verify
the voltage rating.

It's not really a surprise. Considering the popularity of 3-terminal
regulators, it wouldn't be a stretch for one manufacturer to put out
an oddball voltage, or for some company to order enough that they could
have an oddball voltage.

I"m sure we don't see some of the odder voltages for the same reason
that some parts are hard to come by; the hobby type places only
carry common parts, and some of those voltages are hardly common
(though they can be handy).

I got into the hobby just a bit before those three terminal regulators
hit the market, so I can remember them as a new thing. The first
I bought were some "surplus" LM309's (the 5volt regulators had a
special number back then) mounted on heatsinks at the Rochester, NY
hamfest in 1973 or 74. I quickly learned how well they oscillated
if they weren't properly bypassed. I used that pair to drop an
existing power supply down to 5volts for use with a breadboard. I
still have them, and never destroyed them (unlike a lot of things
I played with back then).

The actual mixer is a "Gilbert Cell" mixer, like you'd find in the MC1496 or NE602 (and a lot of other ICs for that matter). It does buffer the output, and there is a stand-alone op-amp built into the package.

On the other hand, it may not be as flexible as something like the MC1496.

The IC never seemed to be all that commonly available, and it sure was never an IC that was commonly seen in the hobby magazines.

Depnding on what you want it for, you may be able to use something else.

What you are looking for is the formula, or a chart, for
"free space loss" which is dependent on frequency. Once
you convert the transmitted signal level (ERP) into a usable
unit (dbm, mv/m) you simply subtract the free space loss and
you'll have a received signal level. Whether or not that is
copiable would depend on the rcvr and its antenna.
The free space loss is very interesting. The difference
between 10 miles and a zillion miles isn't all that
staggering. The bulk of the decrease (numerically) is
immediately close to the antenna. As a caveat, I've never
seen info that relates to particularly short distances.
When you see the loss represented in db on a free-space-loss
graph, doubling power is very insignificant at long
distances in regard to obtaining significant additional
range.

Source record: 57026

I am looking for someone to build a "Balanced Loop Preamp" for my
very large LF (1750 Meter Band) loop. The antenna itself is already
constructed and is ready to go.

The circuit is a design by Lyle Koehler, K0LR and can be found at:

http://www.computerpro.com/~lyle/bal-pre/bal-pre.htm

I will gladly pay for all the parts in advance, and will pay you for your
time.
I need the amp by the end of Novemeber (Winter DX season is nearly here)
so I'm happy to pay more for a rush job.

The pre-amp uses tuning diodes to allow the operator to tune the loop
from the shack. So, I'd need both the remote amp and the indoor
tuning control constructed. I'll supply coax, do the installation, etc.

Serious inquires only please. E-mail me directly after you've
had a chance to look over the design. Please let me know
your price including labor and parts, and an estimate of when you'd
be able to complete the project. Thanks in advance!

Les Rayburn, N1LF

Hey,
looking at a design at
http://home.t-online.de/home/dl5neg/23cm_ant/23cm_ant.htm
I get the feeling something this compact would suite my needs great,
altough I would like
to stack 2 or even 4 of theese, so what would be the best way to do
this?
This is only for reception and not transmission, I would really like to
use 75ohm low-loss
coax witch I have alot of here, instead of expensive RG-8 or similar.
Any suggestions?

Regards
//Ash

HAMFEST October 29, 2000 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST - October 29, 2000

LINDENHURST, LI - NY

On October 29, 2000 the Great South Bay Amateur Radio Club will again
sponsor an indoor Hamfest-Computer Show. The location will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.
This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and access-
ories, software, books, technical manuals, ARRL information, Amateur Radio
License Exams, Door Prizes.

Advanced registration is $15.00 each table. Tables at the door are $20.00
each. Contact Walter Wenzel KA2RGI at 631 957-0218 for table reservations.
NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available.

General admission is $ 6.00. Wife's and children under 12 admitted with no
charge.

VE - ARRL - 12:00 NOON at Babylon Town Hall, 200 E Sunrise Hwy, Lindenhurst.
For exam candidates please remember to bring your original FCC Amateur
Radio license (if licensed), any C.S.C.E. forms that are pending, plus a
photocopy of each, pens, calculator, formal form of ID (preferably photo
ID),
and the examination fee, to the exam session. Current ARRL/VEC fee is $
6.65,
exact change is appreciated.

Talk-in will be via GSBARC Repeater on 146.685 -600 136.5 PL.

Food Service during the Hamfest will be provided by members of the Knights
of Columbus Council.

Information is also available during the GSBARC 2 meter info net every
Monday evening at 7:00 PM following the Newsline Report on the W2GSB
repeater, 146.685 -600 136.5 PL required. You may also write to:

Great South Bay ARC
P.O. Box 1356
West Babylon, NY 11704

Hi Reg!

Here's another question then, could I use a roller coaster inductor
rather than a fixed
inductor ?? This would then remove the need for taps on the coil as it
would be completely
variable over it's entire range, or have I miss understood things ??

I used to be a transistor person back in my hardware days, but these
days I only
do software, but I'm _very_ aware of the HT in the box :)

Cheers!

MikeT ...

Might anybody out there have a Cetec Vega model 212A Repeater Tone Panel manual they might part with or copy for me. I need the whole manual but really, really need the schematic and layout for the 260 interface board. Gladly pay for copying and postage costs. Please reply via email. Thanks Don KB6GQA

3310. Re: 10M -> 15/20/40 Transverter?

I did something like this years ago to get onto some rather odd AF MARS frequencies. It worked quite well.

If one wants to keep the sideband relationships the same, i.e. USB in on 10 give USB out on the other bands, the most obvious LO frequencies won't work well. For instance, 28 MHz IF minus 7 MHz LO yields 21 MHz out, but 7 MHz times 3 is also 21 MHz and times 4 is 28 MHz. Avoid this one! However, 29 MHz IF using an 8 MHz LO might work.

The same sort of thinking also applies to 28 -> 14 MHz conversion, but 29 -> 14 MHz using a 15 MHz LO should work.

28 -> 7 MHz using a 21 MHz LO might work, but I think 29 -> 7 MHz using a 22 MHz LO would be cleaner.

I don't think that any of these would be too clean (i.e. free of spurious stuff) if they are implemented using broadband techniques. But the nice thing about ham radio is that we're allowed to try things as long as we do it carefully.

If it is alright to invert the sidebands, then 28 -> 21 MHz using a 49 MHz LO, 28 -> 14 MHz using a 42 MHz LO and 28 -> 7 MHz using a 35 MHz LO should work.

73, CJ K0CJ

I think that an IF at 12 meters might be better. Maybe a lot better.

3311. RE: UC3906 based charger concerns

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-26 23:55:11 UTC
From: vk3em@hotmail.COM
Message-ID: <LAW2-F35ZRhQdOgl4rh00000ee2@hotmail.com>
Source record: 57038

Hi Bob,

>I word of caution about UC3906 based gel cell chargers and QRP rigs.

Thanks for your interest in UC3906 chargers by the way!

>The UC3906 chip will not come out of the bulk charge mode if there is a
>load of about 30 mA or more connected to the battery.

Actually you wrong on this point. The UC3906 switches to
the OVER CHARGE state when the battery reaches the
OVER CHARGE voltage, in my design this is about 13.75 volts.
I think what you meant to say was the "UC3906 does not
come out of the OVER CHARGE state" if there is a load
greater than 30mA.

>This is because the UC3906 senses current draw to determine when the
>battery is fully charged.

Yes it does, when in the over charge state the UC3906
behaves like a constant voltage regulator of 14.5 volts
from the time it switches to the OVER CHARGE state to the
time it switches to the FLOAT state.

>If a load is drawing current then the chip thinks
>the battery is not yet charged and so it never switches to float mode.

This is correct.

>If your load is equal to or greater than the bulk charge rate then it's no
>problem - all the charger current is going to the load. If however, the
>load is less than the bulk charge rate then the battery
>is receiving some charge and there is a potential for overcharging.

Well, not really. When the charger swaps from BULK charge to OVER
CHARGE state, it swaps from being a current source (of bulk
charge current rate) to a voltage source. Subsequently, as
the battery voltage approaches 14.5 volts, charge current
drops, eventually reaching (Bulk Charge Rate)/25 or 25mA for
a 1 Amp bulk charge.

When you connect a load that draws, say 100mA, and you walk
away and leave the room, the charger in the Over Charge
State will share its charge current between the load and
battery. Remember all the time the charger is trying to
bring the battery voltage up to 14.5 volts.

As the battery charges, the current it accepts will
taper off (and the load current remains the same).
Eventually you end up with a fully charged battery accepting
negligable current and a load that is drawing the rest of
the current.

Since the battery is accepting negligable current, there
is no real danger of over charging the battery. I believe
(but I need to review this) that holding a battery at 14.5
volts in stead of 14v (but not charging it with current)
just maintains a higher pressure level of oxygen inside
the cell. According to Gates Energy manual this is not
an important issue.

I actually proved this point last night when I used two
ammeters to monitor current into the battery and current
into the load. I might document this test if I find the
time. As an aside, As soon as you remove the load the
charger will swap to the float state.

>QRP rig receiver currents are generally in the range that can cause
>overcharging problems.
>
>I am working on a pulse-width type charging circuit in order to avoid this
>problem.

I encourage you with your work on the PWM charger. UC3906's
are getting more expensive and harder to buy. However, I believe
your concerns about over charging are due to a mis-understanding.
Maybe you could have emailed me with your concerns before you
started alarming people about non-issues, but thats your right and
I respect that. I'm glad you brought the issue up, if you have
asked the question, others will have too.

Regards,
Luke

Source record: 57039

Hi Luke,

You are right - I should have said that the UC3906 will not come out of the overcharge mode with a load attached. I'm not sure this is a non-issue however. I'm not saying there is anything wrong with the UC3906 or any 3-state charger but I do think there is a limitation that users need to be aware of.

According to the Power Sonic PS-1229 (2.9 AH) information that I have, with the charger output limited to 14.5 volts when current drops to 30 mA the battery is fully charged and should either be disconnected or switched to the 13.8 volt float charge. My concern is that if the battery is left indefinately with 14.5 volts applied then, even though the current decreases, it may not drop enough to prevent damage. If this were not the case then why have a float mode at all? One could just apply 14.5 volts via a simple current limiter (to limit the bulk rate) and let it go.

If the charger can provide enough current to supply both the load and the battery, the voltage will stay at 14.5 volts. The only thing that limits battery current at that point is the battery itself. The question then is will the battery limit its current enough at this voltage to prevent damage. If the answer is yes then I again have to wonder why do the 3-state chargers have the 13.8 volt float mode and why does the Power Sonic data sheet say to disconnect the charger or switch to 13.8 volts when the 14.5 volt current reaches 30 mA.

John,

We use double's in VB6 to get the tune words on the 9854. Another way to do it is with a pair of long integers and good old sum of products math ie: (a + b) * (c+ d) = ab + ad + bc + bd then split the products into high and low again. Double's are a lot easier .....

Hi,

I should know the theory, but i'm not confident enough to have a go
without some guidance.

can someone point me towards the circuits for a simple transmitter, and
reciver, with the frequencies locked by a common three leg SAW
resonator?
OR if you have circuits for a crystal based version. (I can buy crystals
in the 27 Mhz range)

I'm sure there's got to be a "dummy's guide" out ther for this, but
blowed if I can find it.

I know I can buy premade modules, but this is as much for the learning,
as the the end result.

the end result?.. a small transmitter, pulsing out a digitally generated
code, and a reciever to track and deocde the transimssion.

Please CC responses to des.bromilow@citec.com.au

Many thanks in advance,
Des Bromilow

You are correct. My use of the word "non-issue" was not fair.
It is definantly an issue that needs to be addressed.

>I'm not saying there is anything wrong with the
>UC3906 or any 3-state charger but I do think there is a limitation
>that users need to be aware of.

I really really wish there was a PDF copy of the
Gates Energy Applications Manual for Sealed Batteries.
I don't have time to quote the whole book, but given
that it appears to be out of print, I might even scan
and PDF a few pages for you to read. It is very
detailed. Here is summary of why you should have a
float state.

1st:
The venting of oxygen and/or hydrogen. Over-charging causes
oxygen and hydrogen to be formed on the electrodes. In a
controlled overcharge state, these gases recombime to
form water. Sometimes, if prolonged overcharging occurs,
some gas can escape which effectively like a loss of
eletrolyte. The amount of over-charge current will
effect the venting of gases considerably.

2nd cause:
The positive plate, made up of metallic lead, can
react with the sulphuric acid at elevated temperatures
to form Lead DiOxide, which degrades the lifetime of
the battery. Evelvated temps are cause by overcharging
as mentioned above.

Please Note : The majority of applications problems
of sealed lead acid cells can be attributed to
under-charging of the battery.

It is also interesting to note that "Gates" make it very
clear that the majority of over-charge current goes into
heating the battery (due to the recombination of oxygen).
If anything, this could lead to a temperature sensing
problem because the UC3906 works on ambient temperature
not battery temperature for temperature compensation.

On Page 60, they also mention that it might takes years
to cause damage to a battery if left in continous overcharge
providing the overcharge current is kept small. Thus
the major concern is with over-charging at a fast rate.
The more over-charge current, the more gas (thus pressure)
and heat is produced. They certainly don't seem concerned
about long term over-charging at low overcharge rates.

Thus, the need for a Float state is really related to the
long term health of the battery. A battery left in over
charge for weeks should not be a problem, providing your
not forcing lots of overcharge current into it.

In my tests I used a 1.2Ah battery, with a 180mA bulk
charge and a 80mA load. When I connected the charger,
the load drew 80mA or so and the battery 100mA. I
went to sleep, woke up and the battery was drawing
20mA with the load drawing 80mA. At 20mA, you could
leave a 1.2Ah cell in overcharge for quite a while.
The battery was not even warm. I'll leave it like this
for a week to see what happens.

At the end of the day, you are right to mention this
as a limitation of the charger. How PWM would get around
it - I'm not sure. Maybe a micro controlled charger
with timers is the way to go. However, I think for
99% of users this will not be an issue. Maybe continous
overcharging effects other manufacturers more than
Gates, I don't know.

Thanks for the comments.
It's a very interesting area.
Regards and 73's,
Luke

As I understand it, this depends a great deal on battery design, as well.
The Gates "Cylon" cylindrical cells can stand a fair amount of overcharge
because they can withstand a fair bit of internal pressure without venting.
The more common plastic-case "gell cell" type package has vents that
open at just a few PSI, causing loss of gases. These gases never
recombine to form water, and so the battery loses water. Thus, the
plastic-case batteries cannot tolerate very much gassing at all without
having their life shortened.

If you look at battery data sheets, I believe that the plastic-case
battery manufacturers recommend a lower maximum voltage for cyclic
charging than Gates recommends for their cylindrical cells.

I believe this is also why a float voltage of about 13.8 V is recommended
by plastic-case battery manufacturers. 13.8 V isn't quite enough to fully
charge the plates, but it *is* low enough to prevent gassing. Holding
the terminal voltage at 14.4 V or so will produce gassing, even though
the current may be low, and ultimately dry out the cell. 14.4 V *is*
recommended for faster recharging in cyclic use, but under the understanding
that this voltage will only be applied for a period of hours, not days.

>At the end of the day, you are right to mention this

Fundamentally, the problem seems to be that the 3906 is a sophisticated
charger designed with the assumption that the battery, and only the battery,
is connected to the charger as a load. It simply won't work as designed
if there is any significant load on the battery during charge.

One solution would seem to be to isolate the battery from the
load when AC power is available, powering the load from a separate

regulator (but possibly from the same unregulated DC supply as the
charger). Just use diodes to isolate the battery from the regulator,
set the regulator output voltage higher than the 3906 voltage ever gets,
and the load will draw no power from the battery unless the AC fails.

The compleate board set is available from Far circuts.
The price is $106.00 wich includes a pre programed eprom. All of the IC's
are availabe from Rad Shack,
JDR, Jameco, ECT. If you follow the book you should
not have any problems assembling the rig. True it is
not all nice and pre packaged like the Elecraft, but it
does produce a functional rig. My cost thus far has
been around $250.00. And yes it takes some use of
test equipment, But if you don't have it I'm shure
you will find a local ham that can give you a hand.

Hi Luke,

The info available for download on the Power Sonic web page says essentially the same thing that you quoted from Gates. They do say that float charge current should drop to 0.001C (10 mA for a 10 Ah battery). They also have a chart that shows how float voltage should vary with battery temperature. I'm sure you are correct that what we are talking about is the long-term affects on the battery. Mayby something like a battery that would have a life time of 3 years gets shortened to 2 years??? None of the Mfgs. seem to offer any information as to exactly what the affects of limited overcharging are. I'm not a chemist or "battery guru" so I've been taking the manufacturer's instructions to switch to a float charge as a real requirement. Power Sonic does warn of serious overcharging (i.e. continuing to force high charging currents) - the battery heats up which makes it draw more current which makes it heat up even more - thermal runaway. I don't think that condition is going to occur with a constant 14.5 volts however.

PW charging senses only the battery voltage. When the charger is on, the battery voltage begins to climb (a current limiter prevents charging currents above the specified bulk rate). When it reaches 14.5 volts the charger switches off and the voltage begins to drop. When the battery gets down to 13.8 volts, the charger switches back on. The higher the charge of the battery, the longer it takes for the voltage to drop back to 13.8 and the quicker it climbs to 14.5 so the charge pulses get narrower and farther between (i.e. the duty cycle lowers). The nice thing is that this automatically compensates for varying load conditions. When a load draws current, the battery voltage drops back to 13.8 volts quicker so the pulses speed up to compensate.

Because bandwidth is cheap.
Do you think it should be rationed by price ?

Hi Bob,

>The info available for download on the Power Sonic web page says
>essentially the same thing that you quoted from Gates. They do say
>that float charge current should drop to 0.001C (10 mA for a 10 Ah
>battery). They also have a chart that shows how float voltage should
>vary with battery temperature. I'm sure you are correct that what we
>are talking about is the long-term affects on the battery. Mayby
>something like a battery that would have a life time of 3 years gets
>shortened to 2 years??? None of the Mfgs. seem to offer any
>information as to exactly what the affects of limited overcharging
>are.

And I'm sure it is very dependent on who the manufacturer is.
I've noticed that with my "simulated" load over-charge state
setup, charger current has dropped to 9mA for a 1.2Ah battery,
which is far beyond 0.001C.

>I'm not a chemist or "battery guru" so I've been taking the
>manufacturer's instructions to switch to a float charge as a real
>requirement. Power Sonic does warn of serious overcharging (i.e.
>continuing to force high charging currents) - the battery heats up
>which makes it draw more current which makes it heat up even more -
>thermal runaway. I don't think that condition is going to occur with >a
>constant 14.5 volts however.

No, it won't, otherwise the UC3906 wouldn't work full stop.
It's funny because the most problems I have had with the
UC3906 is with the voltage sense being touchy. That means,
if you connect an already charged battery, it very difficult
to get it to reset into the bulk charge mode. And once
in over-charge mode, and close to 14.5v, its easy to trip
it into float mode, especially with RF. You would think
the extra current drain would keep it there, but instead
it switches. As I said before, I doubt this problem would
really become an issue in most amateur installations. The
best reason to replace the UC3906 would be programmability
via software (For different voltages and battery sizes).
In fact, given that 90% of amateurs charge gel cells
with nothing more than a power supply and a resistor I
think this is a fairly minor problem (in the scope of
things).

>PW charging senses only the battery voltage. When the charger is on,
>the battery voltage begins to climb (a current limiter prevents
>charging currents above the specified bulk rate). When it reaches >14.5

>volts the charger switches off and the voltage begins to drop. When
>the battery gets down to 13.8 volts, the charger switches back on. >The
>higher the charge of the battery, the longer it takes for the voltage
>to drop back to 13.8 and the quicker it climbs to 14.5 so the charge
>pulses get narrower and farther between (i.e. the duty cycle lowers).
>The nice thing is that this automatically compensates for varying >load
>conditions. When a load draws current, the battery voltage drops back
>to 13.8 volts quicker so the pulses speed up to compensate.

It sounds interesting. Please keep me informed with your
work and I'd really be interested in field testing a
unit for you. This sounds like a great improvement upon
a 3 state charger, although the initial cost might be
a little higher. However, you could also use a FET
switch instead of a high current BJT, will will reduce
the cost.

One thing tho, do be careful with PWM and RF EMI. You
still want to use your charger and listen to HF too.

I will add your concern to the FAQ on the site incase
someone intends to use it in this situation. My charger
gets a fair bit of use so it never ends up sitting on
one battery for too long. I suspect most other people
have the same problem - too many batteries and not
enough chargers. It might actually be a relief to have
enough chargers to leave one connected to a battery
for a few years. :)

Regards,
Luke

Following the above , a question from this side .

Having a combination of 'wet' deep cycle lead acid batteries and gel type (hermetically sealed) batteries on a header charged by a wind generator , an electronic shunt set at 13.75 V prevents all the batteries from being charged above this voltage.
Knowing that at this voltage the batteries are not fully charged I would like to set the electronic shunt 'for a limited time' at 14.5 V . For how long can this be done without damaging (read: venting)the sealed lead acid batteries and at what intervals to get optimal performance from the sealed batteries?
The temperature of the room (radio shack) where the sealed batteries are located never exceeds 23 Degr.Celcius .
The 'wet' deep cycle batteries are located remotely on a well ventilated loft.

TIA for any advice

73 Frank gm0csz.kn6wh@ukrs.org

Source record: 56899

Dear Friend:
With a couple of minutes of your time I'm
going to show you how you can
turn
$6 and
6 stamps into thousands of dollars. Don't
get skeptical yet, just read
the
letter and then decide if you want to invest
a measly $6!!

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND:
READING THIS COULD CHANGE YOUR LIFE! Wow!!
IT DOES WORK!

A little while back, I was browsing through
newsgroups, just like you
are
now, and came across an article similar to
this that said you could make

thousands of dollars within weeks with only
an initial investment of
$6.00!
So I thought, "Yeah right, this must be a
scam", but like most of us, I
was
curious, so I kept reading. Anyway, it said
that you send $1.00 to each
of
the 6 names and address stated in the
article. You then place your own
name
and address in the bottom of the list at #6,
and post the article in at
least 200 newsgroups.
(There are thousands) No catch, that was it.
So after thinking it over,
and
talking to a few people first, I thought
about trying it. I figured:
"What
have I got to lose except 6 stamps and
$6.00, right?" Then I invested
the

measly $6.00. Well GUESS WHAT!?...Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just

kept coming in. In my first week, I made about $25.00. By the end of the

second week I had made a total of over $1,000.00! In the third week I had over 10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly.
It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how

this works and most importantly, WHY it works... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy!
Six Bucks and Six stamps... not a big deal to get lots more $$$$. IT WORKS!!!!
Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in! It's easy.
It's legal. And, your investment is only $6.00 (Plus postage).

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk - it really works! If all of the following

instructions
are adhered to, you will receive
extraordinary dividends.

PLEASE NOTE:
Please follow these directions EXACTLY, and
$50,000 or more can be yours
in
20
to 60 days. This program remains successful
because of the honesty and
integrity of the participants. Please
continue its success by carefully
adhering to the instructions.
You will now become part of the Mail Order
business. In this business
your
product is not solid and tangible, it's a
service. You are in the
business
of developing Mailing Lists. Many large
corporations are happy to pay
big
bucks for quality lists. However, the money
made from the mailing lists
is
made from people like you and me asking to
be included in that list.

Here are the 4 EASY, EASY, EASY steps to
success:

STEP 1: Get 6 separate pieces of paper and
write the following on each
piece
of paper "PLEASE PUT ME ON YOUR MAILING
LIST."
Now get 6 US $1.00 bills and place ONE
inside EACH of the 6 pieces of
paper
so the
bill will not be seen through the envelope
(to prevent thievery).

Next, place one paper in each of the 6
envelopes and seal them. You
should
now have 6 sealed envelopes, each with a
piece of paper stating the
above
phrase, your name and address, and a $1.00

bill. What you are doing is
creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a
legitimate service and you are paying for
it! Like most of us I was a
little
skeptical and a little worried about the
legal aspects of it all. So I
checked it out with the U.S. Post Office
(1-800-725-2161) and they
confirmed
that it is indeed legal. Mail the 6
envelopes to the following
addresses:

1) Sue Wagner
608 First Avenue
Altoona, PA 16602

2) C. Mangan
503 Oak Ave NW
Elkader, IA 52043

3) Richard Powers
748 Battlefield Blvd. South
Chesapeake, Va. 23322

4) Ryan Palmer
6595 380th Ct.
North Branch, Mn 55056

5)Susan Moreland
233 cr 190
Longbranch, TX 75669

6)Carrie McDonnell
3130-109 Ave S.W.
Calgary, AB Canada
T2W 3H2

STEP 2: Now, you do not need to re-type this
entire letter . Simply put
your
cursor at the beginning of this letter and
drag your cursor to the
bottom of
this document, and select 'copy' from the
edit menu(or right mouse click
and
choose "copy"). This will copy the entire
letter into the computer's
memory

temporarily. Now click "Start" then
"accessories" then "wordpad" Open a

blank 'notepad' file and place your cursor
at the top of the blank page.

>From the 'edit' menu select 'paste'.(or
right mouse click and choose
"paste") This will paste a copy of the
letter into notepad so that you
can
add your name to the list. Take the #1 name
off the list that you see
above,(to do so, put your cursor at the end
of the address of the FIRST
(#1)
address and click "backspace" until name and
address are gone.) Change
the
other numbers to one lower number (6
becomes 5, 5 becomes 4, etc...) by

putting your cursor on the right side of
each number and pushing
backspace
one time, then type the new number and add
YOUR Name as number 6 on the
list. (when you add your name it may be
double spaced... thats ok.)

STEP 3:. Now, post your amended article to
at least 200 newsgroups (I
think
there are close to 24,000 groups). All you
need is 200,
but remember, the more you post, the more
money you make! You won't get
very
much unless you post like crazy. :) This is
perfectly legal! If you have
any
doubts, refer to Title 18 Sec. 1302 & 1341
of the Postal lottery laws.
Keep
a copy of these steps for yourself and,
whenever you need money, you can

use it again, and again.

PLEASE REMEMBER that this program remains
successful because of the
honesty

and integrity of the participants and by
their carefully adhering to the

directions. Look at it this way. If you are
of integrity, the program
will
continue and the money that so many others
have received will come your
way.

NOTE:
Iit might be a good idea to wrap the $1 bill
in dark paper to reduce the

risk of mail theft.) As each post is
downloaded and the directions
carefully
followed, six members will be
reimbursed for their participation as a List
Developer with one dollar
each.
Your name will move up the list so that when
your name reaches the #1
position you will be receiving thousands of
dollars in CASH!!! What an
opportunity for only $6.00 ($1.00 for each
of the first six people
listed
above) Send it now. Add your own name to the
list and you're in
business!

---EASY STEP BY STEP DIRECTIONS ----- FOR
HOW TO POST TO
NEWSGROUPS------------

From: Bob Lewis <rlewis@staffnet.com>
Message-ID: <XfHK5.1177$OG1.3465@newsfeed.slurp.net>
Source record: 56906

Since the discussion on SLA chargers, I've found some additional information. There appears to be two overcharge situations. One, I'll call serious overcharge. This can be caused by exceeding the maximum charge rate for the battery (you connect a solar panel that is capable of supplying 2 amps directly to a battery rated for a maximum of 500 mA). It can also be caused by highly elevated voltages (you connect a solar panel directly to a battery and permit the voltage to climb to 16 or 17 volts). In these cases the battery overheats which causes more current draw which causes further heating - thermal runaway. A battery can be destroyed in a few hours by this type of overcharging.

The other I would call minor overcharging. This is the case of a charger becoming locked in the absorption or overcharge mode and applying a constant 14.5 volts to the battery. In this case oxygen and hydrogen are generated inside the battery at a rate greater than it can be recombined into water for the electrolyte. Pressure builds inside the cell. In the case of plastic cased batteries, a vent opens at a few PSI to release the gases into the atmosphere. This results in drying of the electrolyte over time and a reduction in service life of the battery. So, maybe the battery only lasts a year instead of 3 or 4 years. How much reduction depends on how often and how long you leave the battery in this type of overcharge condition.

NOW AVAILABLE, Program "SWRMETER.exe"

This program models and assists with the design of the
common HF Standing Wave Meter. Enter its essential
characteristics and the program constructs it and calibrates
it against the users standards ready for use.

Input data includes source/Tx internal resistance if known.

Extensive notes:- Principles, circuit diagram and
description, key component values, points to look out for.

Enter any load impedance R + jX and meter readings of
forward power, reflected power, reflection coefficient
magnitude and SWR are computed. Indicated values are
compared with true calculated values.

Continuously vary all input data in small increments on a
what-if? basis while observing meter indications.

Operating circumstances, including input resistance of
source, under which measuring errors will occur are
demonstrated and discussed.

This program is contained in a single executable file of
64.5 Kilobytes.

Hi,

Motorola MJ3040
Si NPN
Vcbo(max) = 400V
Vceo(max) = 300V
Ic(max) = 7A
Ptot = 100W @ Junction Temp of 150C
hFE(min) @ 300mA = 100

Unfortunately there isn't a figure for fT in the book but I
suspect they are simply low-ish frequency, high voltage, moderate
gain, power devices.

Cheers - Joe

Hiya Bob,

>Since the discussion on SLA chargers, I've found some additional
>information. There appears to be two overcharge situations. One, I'll
>call serious overcharge. This can be caused by exceeding the maximum
>charge rate for the battery (you connect a solar panel that is >capable of
>supplying 2 amps directly to a battery rated for a maximum >of 500 mA). It
>can also be caused by highly elevated voltages (you >connect a solar panel
>directly to a battery and permit the voltage to >climb to 16 or 17 volts).
>In these cases the battery overheats which >causes more current draw which
>causes further heating - thermal >runaway. A battery can be destroyed in a
>few hours by this type of >overcharging.

This could also occur due to severe temperature sensing error,
such as having the temperature sensor in "the shack" and a
bank of batteries in the outside environment. Temperature
tracking appears to be quite important with SLA batteries.

>The other I would call minor overcharging. This is the case of a
>charger becoming locked in the absorption or overcharge mode and
>applying a constant 14.5 volts to the battery. In this case oxygen >and
>hydrogen are generated inside the battery at a rate greater than >it can be
>recombined into water for the electrolyte. Pressure builds
>inside the cell. In the case of plastic cased batteries, a vent opens
>at a few PSI to release the gases into the atmosphere. This results >in
>drying of the electrolyte over time and a reduction in service >life of the
>battery. So, maybe the battery only lasts a year instead >of 3 or 4 years.
>How much reduction depends on how often and how long >you leave the battery
>in this type of overcharge condition.

As someone else mentioned before, it would also depend on the manufacturer
as Gates seem to show little concern about it,
although Gates batteries are constructed very differently from
anyone else. Temperature sensing is very important for over-charge,
although I don't know how appropiate it is to have the sensor
inside the control chip which is inside a box. In the case of
the UC3906 I use in my design, by the time you reach the critical
period in the over-charge cycle of the charger, the battery current
has reduced to a very small amount, thus the power dissapated
by the pass device and power diodes is very small and this
adds a small error to the temp sensing.

However, should you connect a load (as described in previous mail),
the power dissapation would go up, and the error increase.
It is probably more important to not use the UC3906
with a load due to this problem, than with the over-charge

lockup, although both are good reasons to avoid using the
UC3906 charger with a load. It would be great if you could
address both of these issues in your PWM design.

Cheers,
Luke

OK, I got the manual....all voltages, resistances check out....the 50K pot checks out.

the problem I have is connected with the clock circuitry, which involves a x29a829 transistor (Q2)etc. I cannot find this transistor on Mouser or Digikey etc....any ideas as to possible substitutes?

Thanks to everyone for your help

Please repond to me directly, not thru digest to conserve digest BW.
Reply to dave_shalita@juno.com if mail to af389@lafn.org bounces.

I bought VE3ERP HamCalc and it is just FINE collection with WIN98.
Great job MURPH!
Menu A13 Zounds.bas will not produce any sound/tones on my
Pentium with built-in speaker and two external speakers
driven by sound card.
On my PC386 I do hear sounds/tones from Zounds.bas.

Also ran this BASIC program to further test my Pentium.
Never hear any scales on either speakers but program seems to run.
This test program does create tones/scales on PC386.

```
10 scale$ = "CDEFGAB"
20 PLAY "L16"
30 FOR i% = 0 TO 6
40 PLAY "O" + STR$(i%)
50 PLAY "X" + VARPTR$(scale$)
60 NEXT i%
```

Should the inbuilt speaker beep when PC is first turned on? Mine does
NOT.
Does Zounds.bas play over the sound card driven speakers?

Do I need to load sound card DOS drivers, so far have not.
Appreciate any OFF_LINE HELP. 73, W6MIK, Dave

That is a 30 amp bifilar-wound filament choke for a tube type linear amplifier. Goes in line (in series) with the filament leads to the tubes. Drive will be applied on the tube side of the choke. Good for 80 meters up.

Dick

Hi,

Sorry about the number mix-up.

Motorola MJ4030
Si PNP Darlington
Vcbo(max) = 60V
Vceo(max) = 60V
Ic(max) = 16A
Ptot = 150W @ Junction Temp of 200C
hFE(min) 1000 @ 10A

Hi,

This time I double-checked the number :-)

Motorola MV1404
Si Varicap
Vrm = 12V
If(max) = 250mA
Ct = 120pF @ 2V
Delta C = 120pF
Fc = 400MHz
Tj = 175C

3353. Want to build a Crystal Controlled LO

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-10-31 08:22:01 UTC
From: John Carlton <jcarlton1@optusnet.com.au>

I am wanting to build a Crystal Controlled Oscillator that is 'reasonable' temperature/environment stable.

A site would really help with this.

Looking for examples for how to calculate the required Inductors/Resistors/Capacitors and which type of transistor would be appropriate.

Looking at making a Crystal LO for 130-140MHz. Needs to be reasonable stable on frequency.

Depending on what you mean by 'reasonable' stable.

>Looking at making a Crystal LO for 130-140MHz.

That is quite a high frequency for a crystal oscillator, which would
require a 7th or 9th overtone crystal and these are quite delicate and
often hard to start. I have never build crystal oscillators above 116
MHz. If higher frequencies are required, they are either followed by a
frequency multiplier(chain) or some kind of PLL is used.

>Needs to be reasonable stable
>on frequency.

Two transistor Butler oscillators are often used in high stability
crystal oscillators around 100 MHz.

http://www.qsl.net/ei9gq/vhf_conv.html

This oscillator starts reliably and is stable enough for SSB/CW on 2M.

I am trying to help a fellow ham in adding an amplifier for
1296 operation.

He is not close so can't just look at the equipment.

Question, how is the TS790 configured for keying the amplifier.
There is a 7 pin connector on the back. Is there a separate
pin for each band? Are there relay contacts or open collector outputs
to key the amplifier. How are the different bands controlled?
He has an existing 144 MHz amplifier so am trying to figure out how to
add the new one.

Any advice on controlling the amplifier would be appreciated.

Bill K7NOM

3357. SSB Crystarl Filters - thanks

Hi,
Thanks for all the posts and mails sent in answer to my original
posting. One source of the classic 9 Mhz filter and crystals is:

www.xs4all.nl/~barendh/Indexeng.htm

This firm seems to have good service and plenty of bits for the
microwave field as well.

Regds,
Hamish

See http://www.qsl.net/ke5fx/tr503.html for an example of a very simple
110 MHz synthesizer with continuous tuning over a narrow range. Might
be helpful, depending on what you're actually trying to do.
